tiny house

The aim of this project is to follow the process of designing a “Tiny House”.

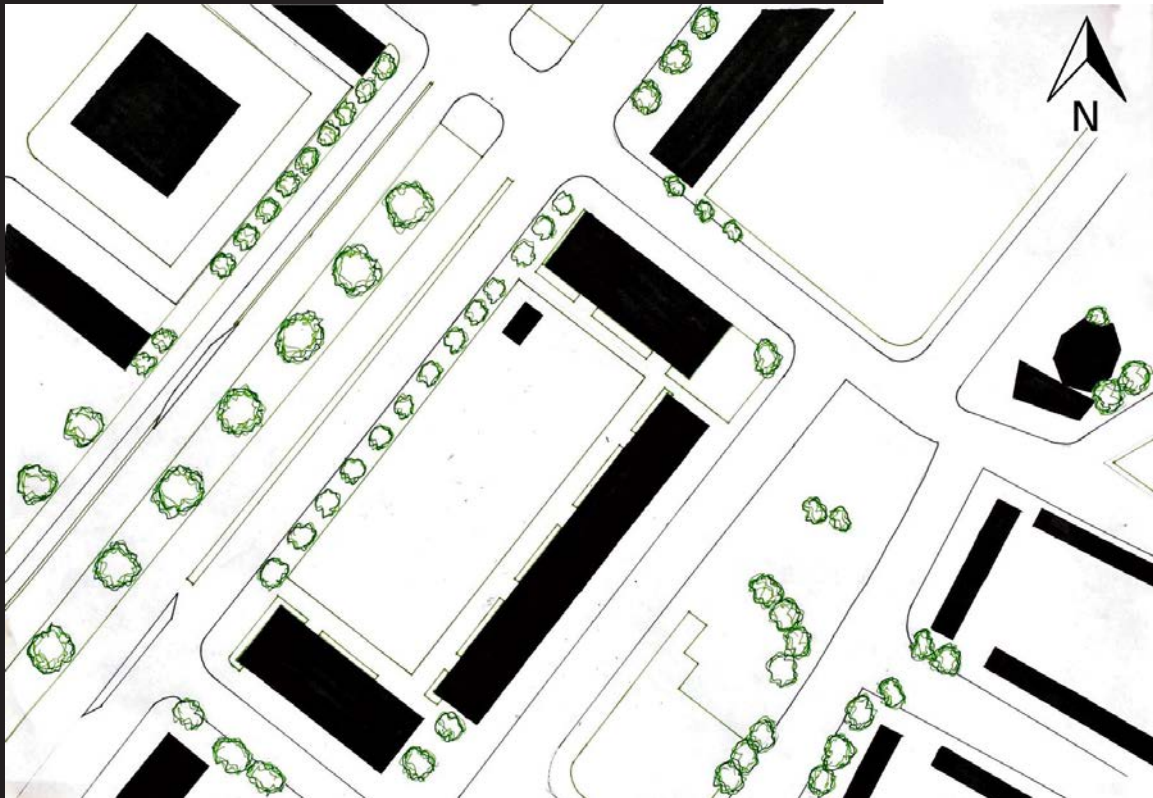

The first step was to create a list of requirements that will analyse themes such as comfort, health, safety, sustainability, circularity, energy. Consequently, the main material - the Dutch brick - was chosen.

After the first final design idea was chosen, the following step was to analyse the technical BPS and SED themes. In the end the themes were applied to the initial design in order to conclude the official final design.

In the picture below the final design choice of the tiny house can be seen.

tiny house final design

tiny house & its context

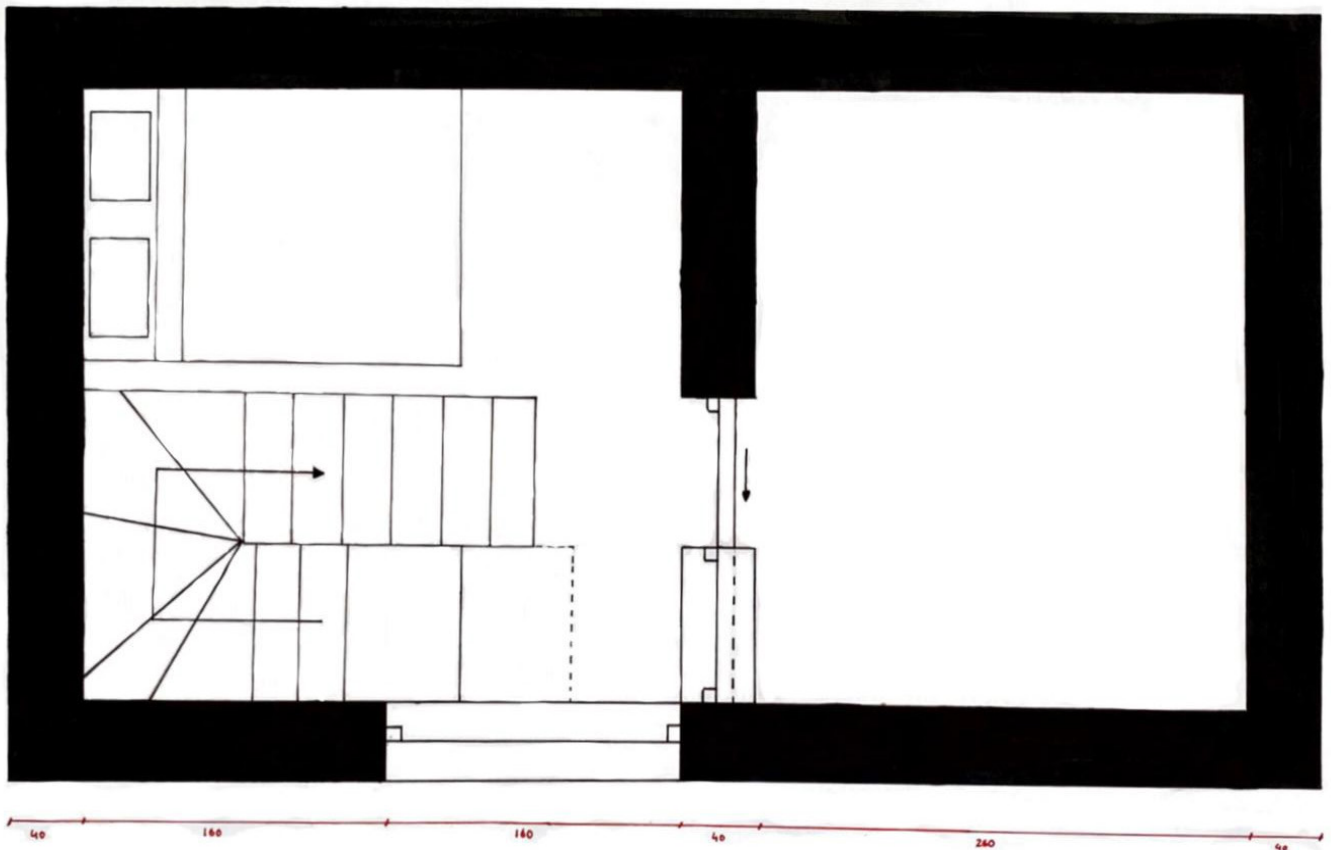

location

There are three apartment buildings placed on the sides of the field. The main entrances of the apartments face the field.

The buildings form shadows throughout the day and as a consequence most of the time the field is not hit by direct sunlight. The “free” side of the field is formed by a small road with the busy road next to it.

The roads directly surrounding the field are accessible for cyclists. The field is located close to a busy road, furthermore there are some main roads within the nearby area.

As a result, the final placement of the house was chosen in the northernmost point of the field, as far as possible from the apartment buildings in order to get as much sunlight as possible.

tiny house first floor plan

first floor space arrangement

As seen in the picture above, the first floor is represented only by the sleeping space, the bedroom, and the recreational space, the terrace.

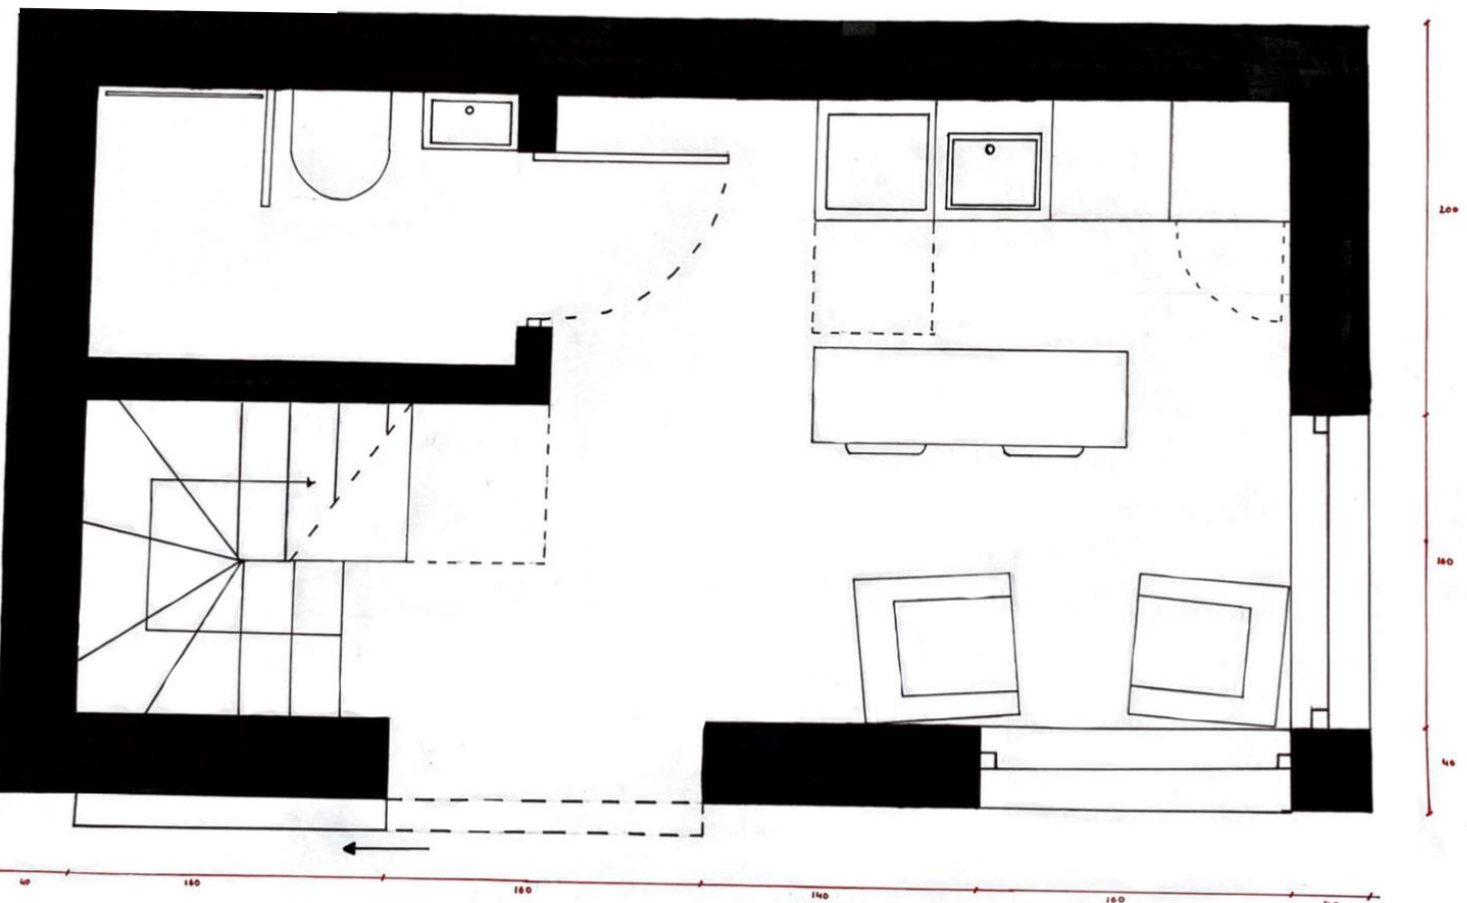

The bedroom was placed on the first floor in order to provide more privacy and comfort for its residents.

Moreover, the bed was placed further from the road so that

there would be less noise pollution.

Regarding the recreational space, the floor would be covered with grass in order to create a final product that will look like a "green" roof, which would ensure more comfort, as well as a more aesthetic look and feeling.

The first floor would be accessed by stairs.

tiny house ground floor plan

ground floor space arrangement

However, the ground floor is much more complex than the first floor and it is also the main floor of the tiny house.

The bathroom, which includes a sink, a toilet and a shower, is the only separate room on the ground floor.

The space for the kitchen was chosen in the house corner which has no windows. The kitchen includes a sink,

a fridge, a cooker and some cabinets.

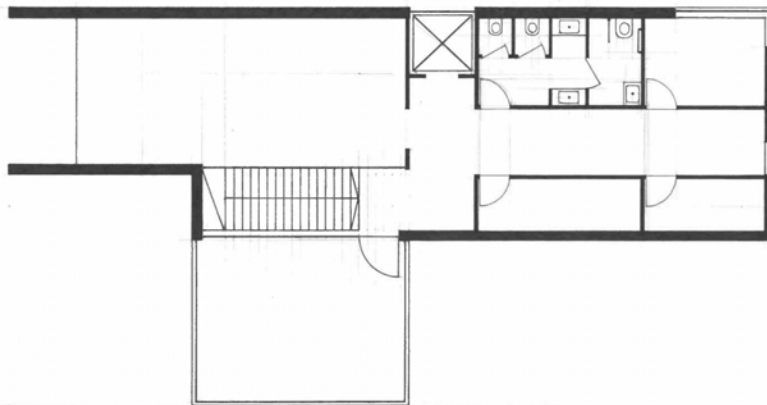

There is also a eating space represented by a table and two chairs.

The “living room” area was placed in the corner of the house which has two windows, in order to provide more comfort and a feeling of wellness when spending time there.

ground floor plan

first floor plan

park pavillion

The aim of this project is to create a park pavillion which includes a main space (a meeting space, an exhibition space) and some serving spaces (an office, bathrooms, a storage space, an utility room, some circulation space and an entrance), the final building also having an outdoor space.

On the left page, the ground floor and the first floor plan of the building can be seen.

The ground floor of the park pavillion is represented by the meeting space, which has a staircase, for everybody, and an elevator, in order to ensure acces to the first floor for both disabled people

or people who prefer it other using the stairs.

The second floor is composed mainly of an exhibition space, other serving spaces and a terrace.

In order to get a better view of the space itself, two sections were drawn.

The length section shows the angle of the stairs, the green wall supporting the overhang and some other details of the building.

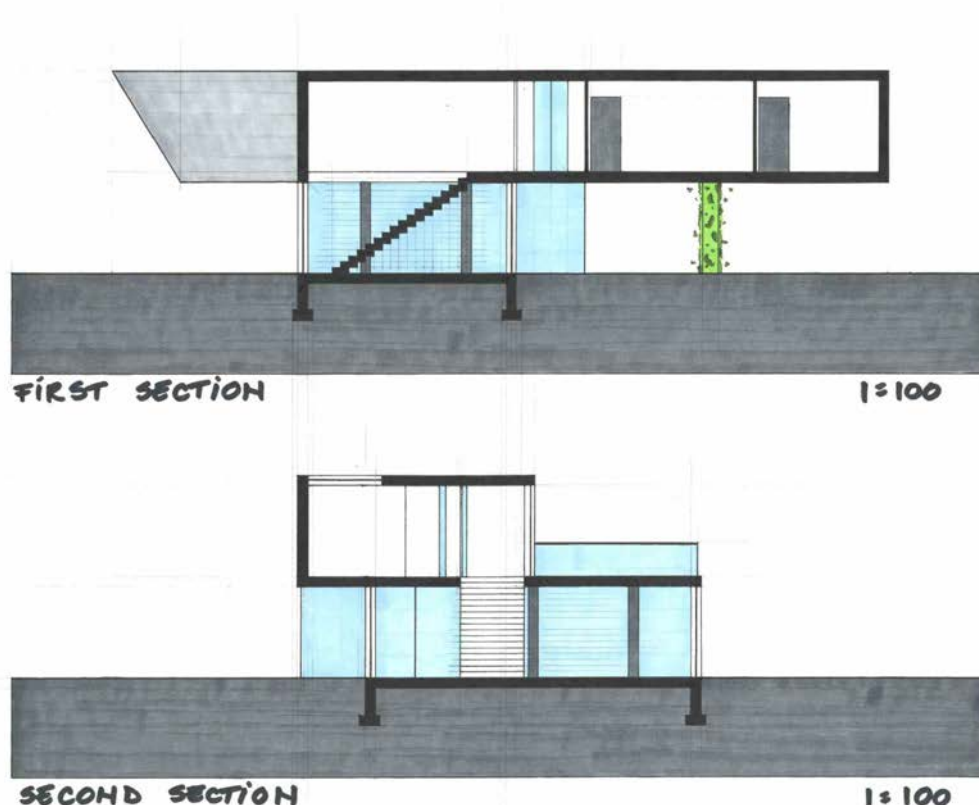

The width section shows the stairs from a frontal view, the various glass walls of the park pavillion and other details such as a skylight window.

Under the otherhang, a cafe will be set up in order to use the large created space.

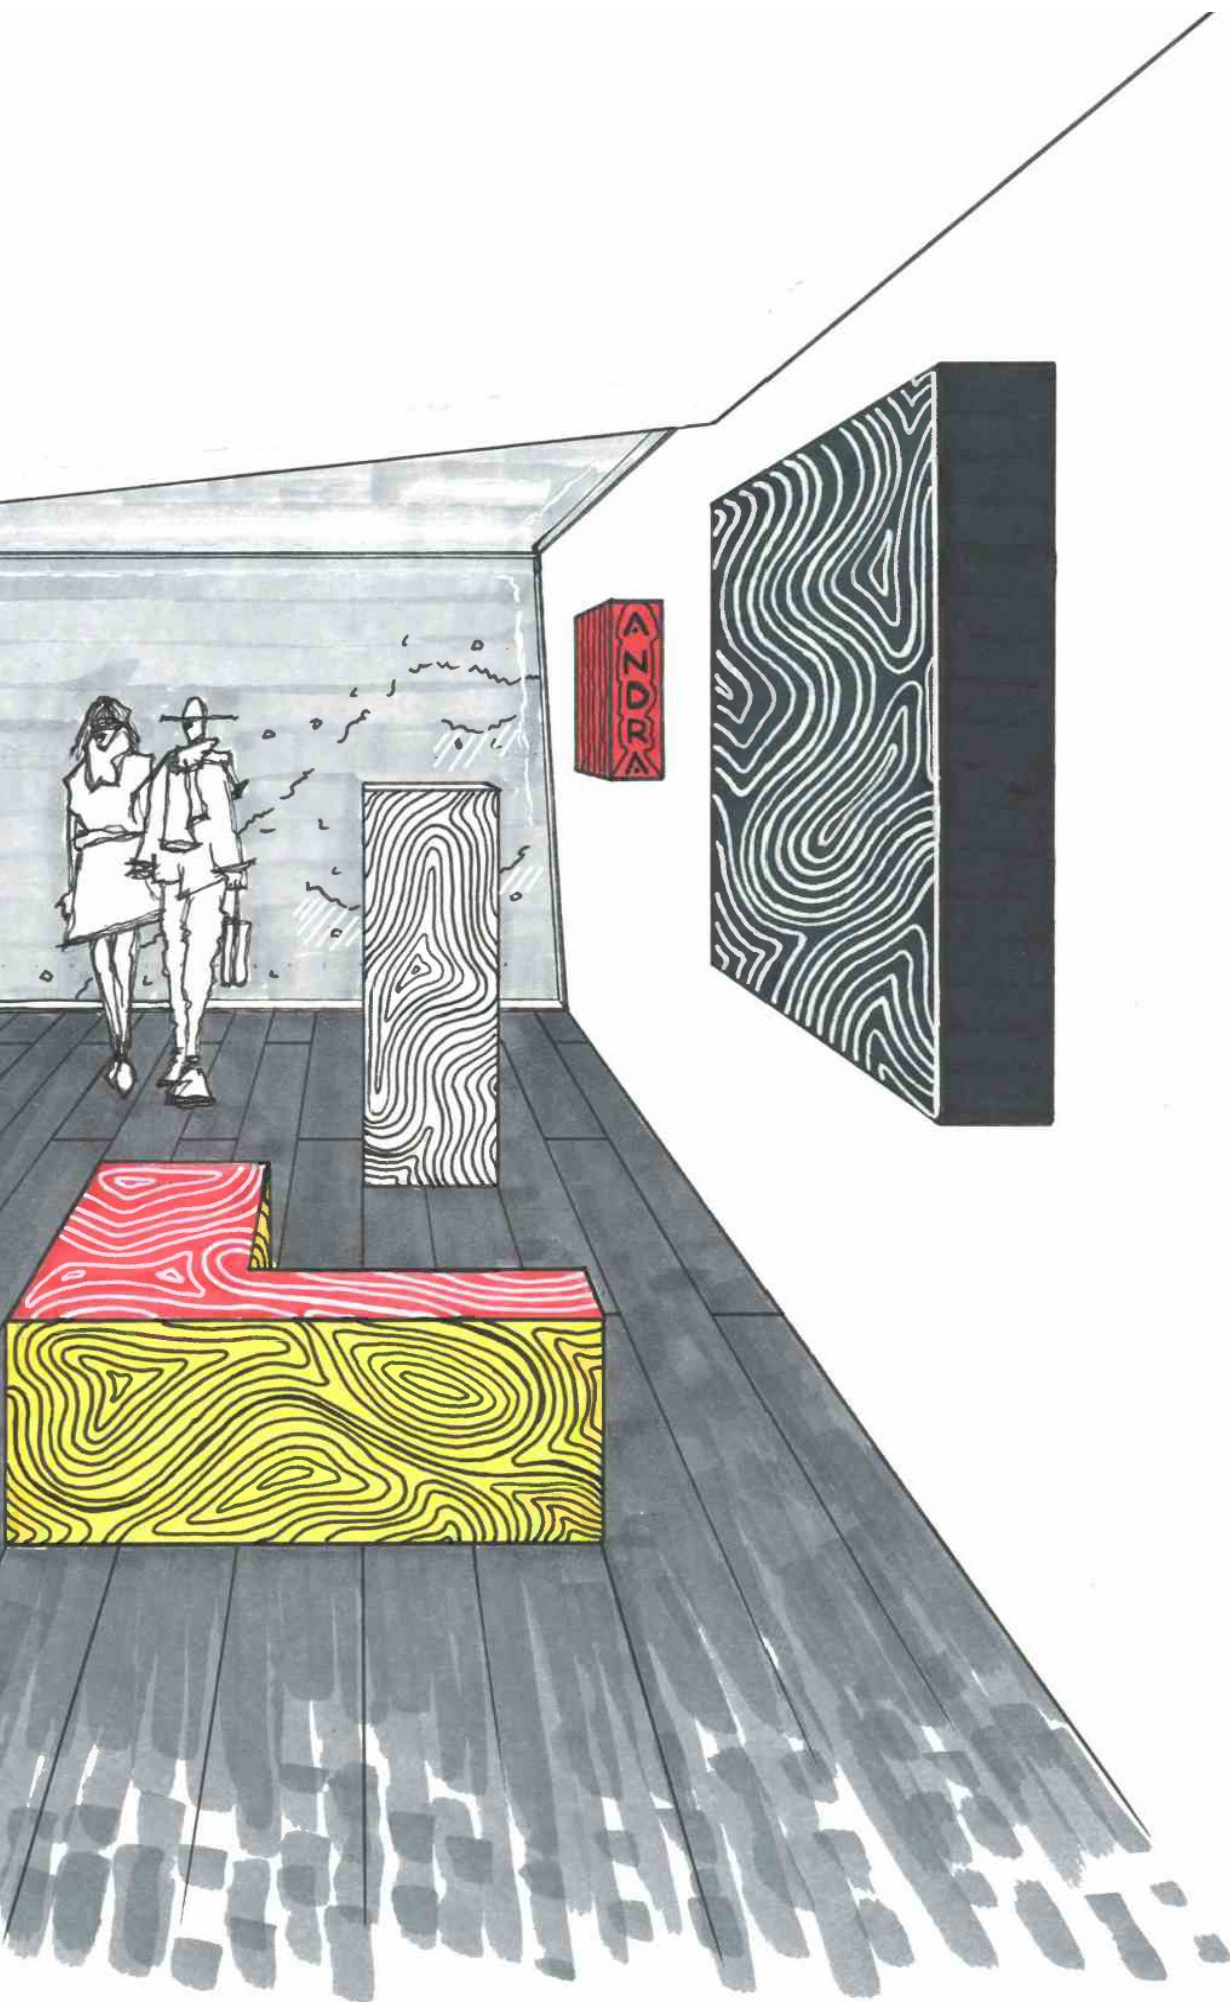

A name alternative for the cafe is "Shadow Cafe" because of the space where it will be placed will be mostly covered by a major shadow.

The green wall, in addition to supporting the otherhang, it also has an aesthetic role as it adds a splash of colour to the massive and grey concrete walls.

On the next to pages, an interior perspective of the exhibition space can be seen.

community.

The analysis will include the architectural and urbanistic aspects regarding the NGG Church.

As the church is a monument, the exterior cannot be changed. Hence, a zone plan was created in order to showcase the interior renovations of the church.

interior view library room

interior view from above

As seen in the pictures above, the church was transformed in a library.

Between the columns and on some of the walls, bookshelves were placed.

A glass box was created inside the library room in order to separate the reading area from the other recreational space where a piano is

placed.

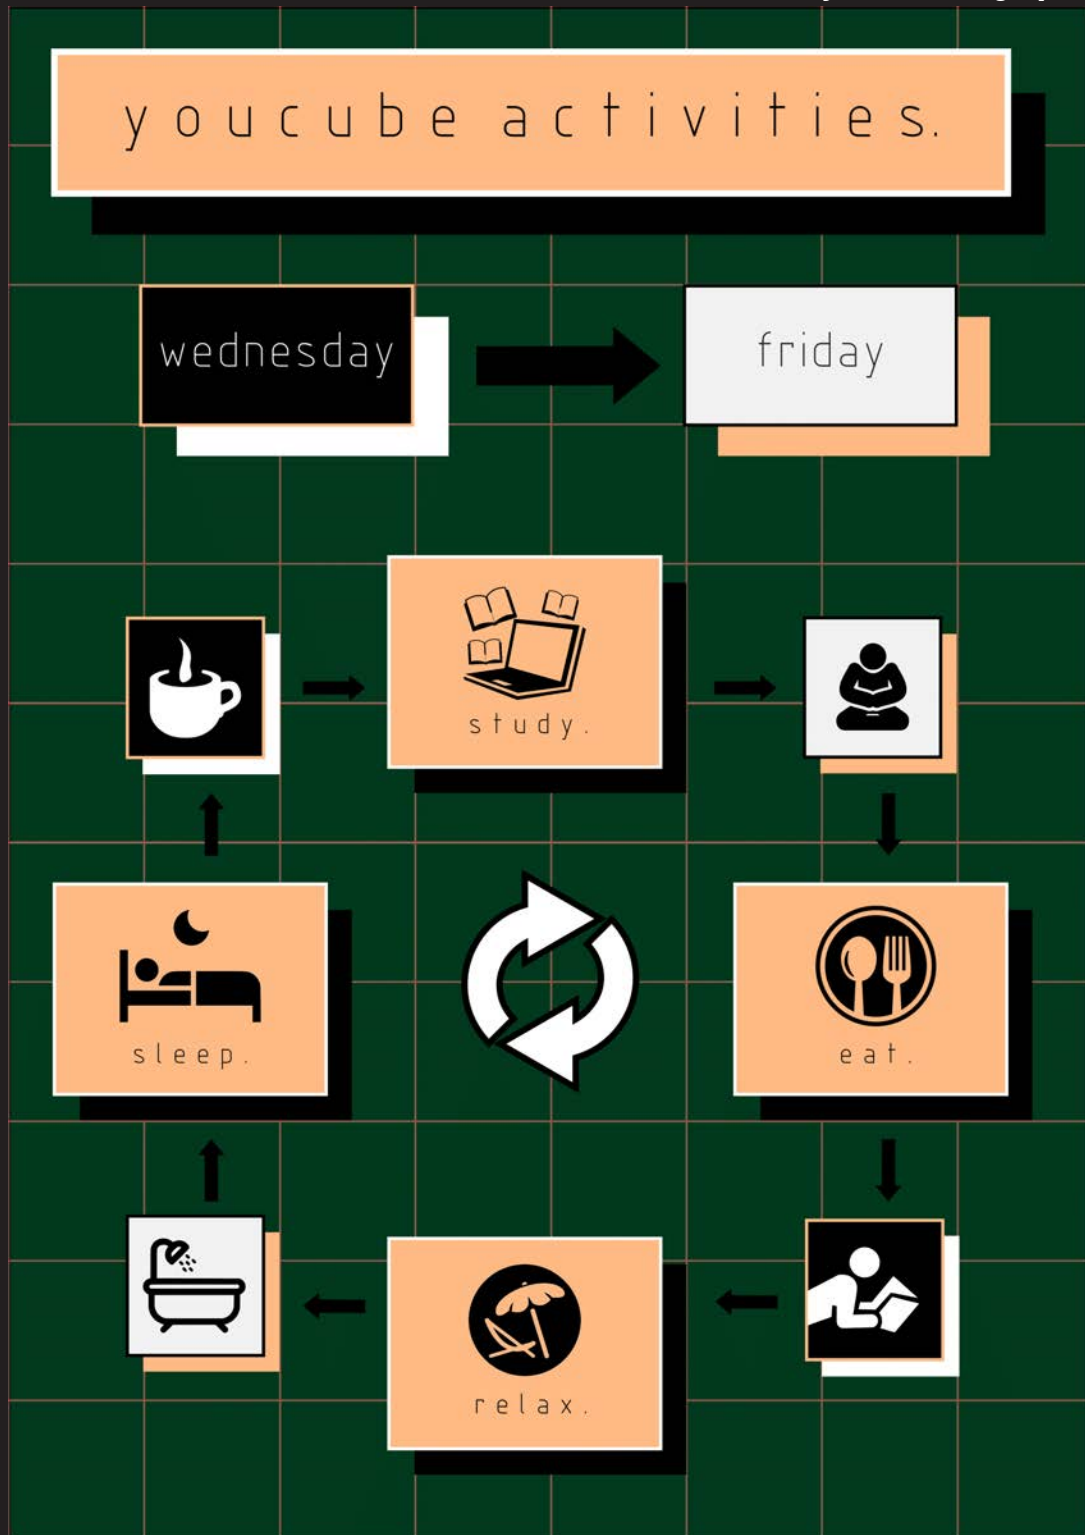

Other objects like sofas and armchairs were placed inside the library room in order to create a cozy place, perfect for reading or meditating.

Except

from

media &

& skills

The infographic above was created in order to show the activities that are happening in the YouCube during 48 hours, from Wednesday until Friday. The main activities are represented by sleeping, drinking coffee, studying, meditating, eating, reading, relaxing and finally taking a bath.

The main colours used are dark green, light orange, black and white.

map

The map seen below was created in order to represent the placement of the YouCube on the TU/e Campus.

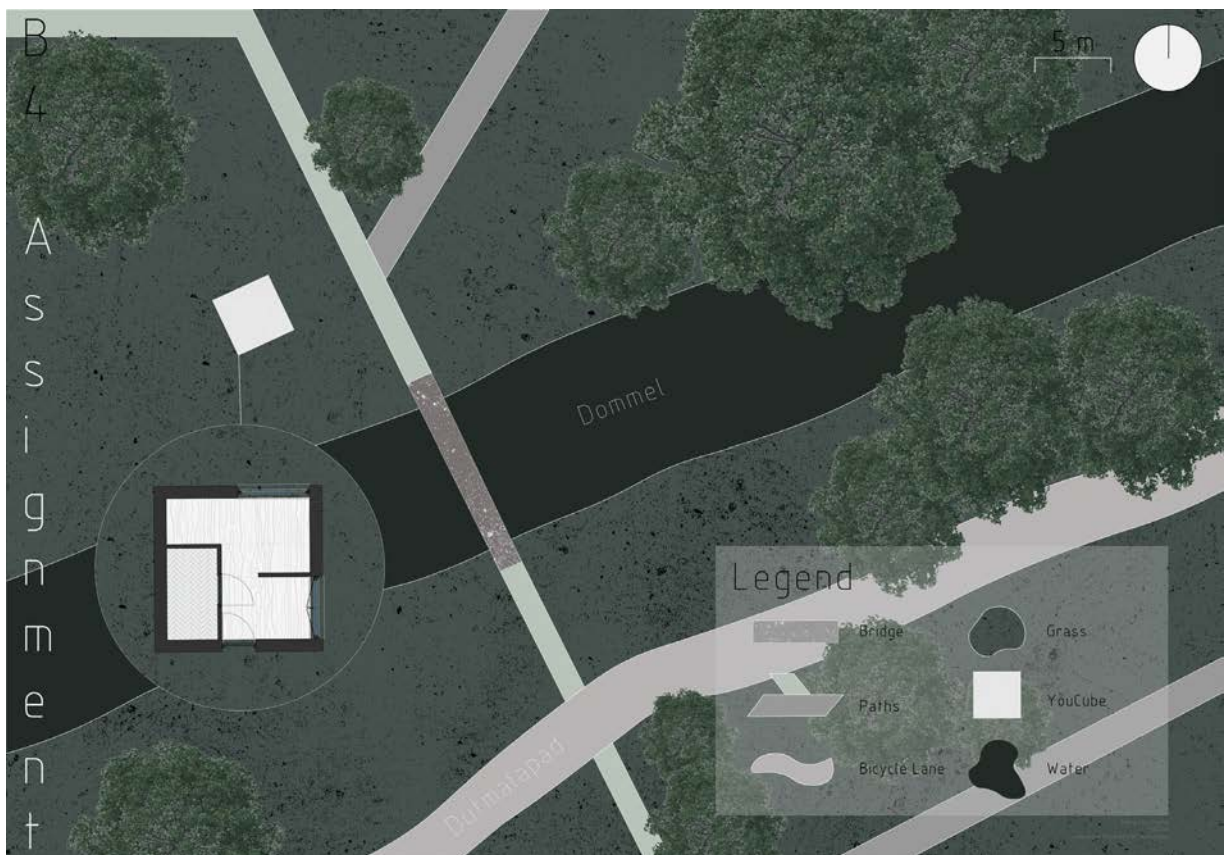

The location was chosen near the Dommel, in a calm and quiet area.

In the same region of the campus a bicycle lane, Dutmalapad, and multiple paths surrounded by green areas can be found around the YouCube.

The main material used for the house is concrete and that is why the YouCube was represented using a light greyish and spotty colour.

Regarding the colour palette used for this assignment, different shades of the same green, various shades of the same grey, black and white were utilized only in representing different objects.

The map also includes: a 5m scale, a compass drawn in a more minimalistic way in order to show where the North is and a legend that explains every element of the map, from artificial ones like paths, the bridge, the bicycle lane and the Youcube, to natural ones like water and green areas (minus the trees).
