Spatial Imagination | 7EA6B20 | Drawing Workshops

Assignment 1 - Experiencing Space

In the first assignment, we transformed spatial experiences into 2D images by different observation and drawing methods: blind drawing, drawing with perspective by observation and drawing from memory.

Drawing by Imagination - Void above workshop Vertigo

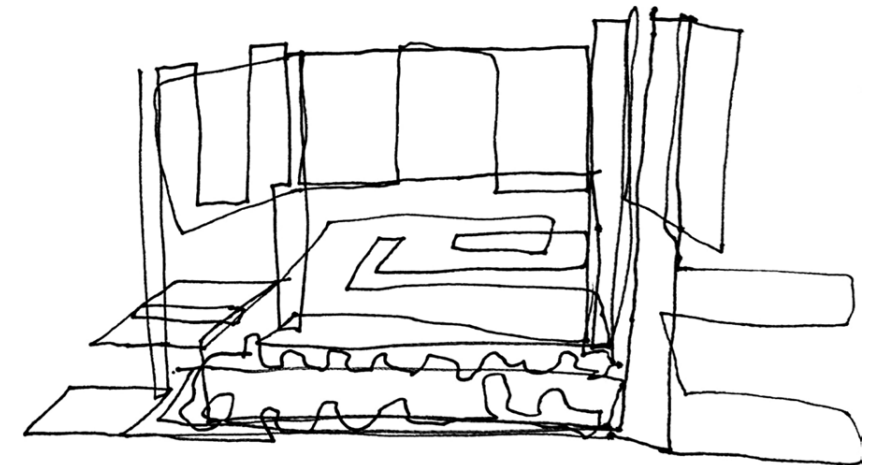

Two-point Perspective - Void Vertigo 1

One-point Perspective - Void Vertigo 1

Blind Drawing 1 - Void above workshop Vertigo

Blind Drawing 2 - Void above workshop Vertigo

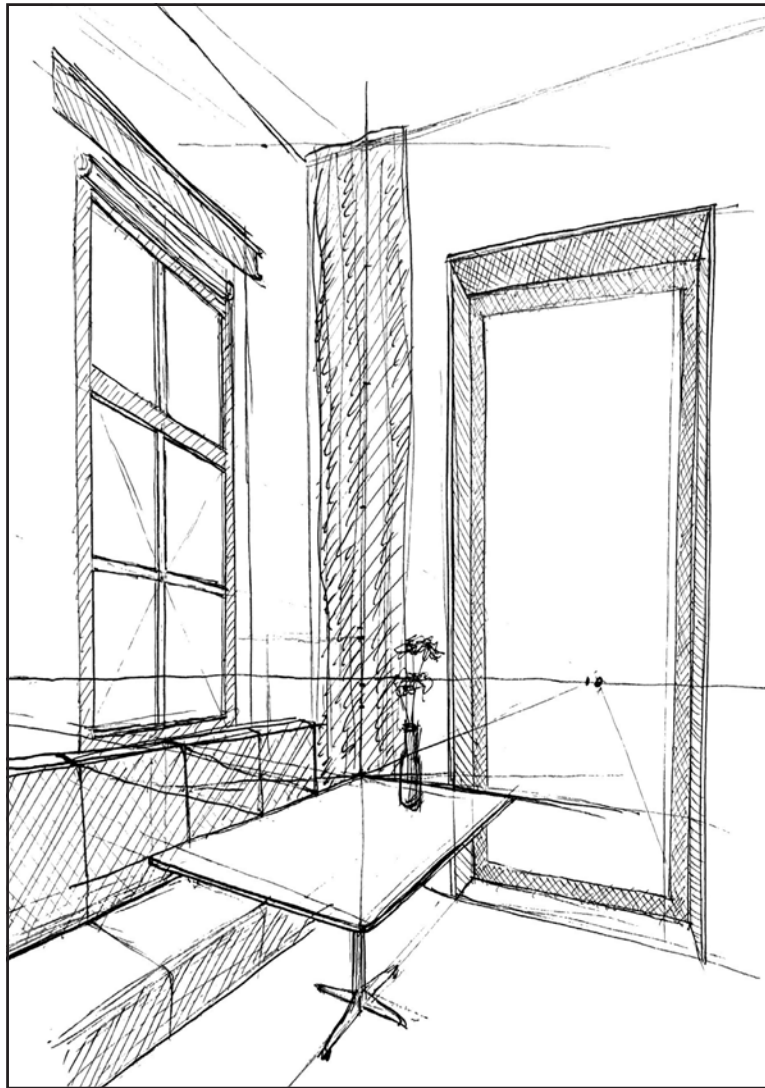

Blind Drawing 3 - Topview, students drawing in workshop of Vertigo

Conclusions - Drawings in-class

This assignment was very insight-full and fun to do. Especially the blind drawings were difficult but also most fun to do. The size of the space made it difficult to capture everything in an organized and (quite) straight way. The more focussed drawing of the students turned out better since I did not need to scan the whole space which made me sometimes lose track on paper.

The perspective in the drawing by imagination is not fully right, since I both used a 1 point and 2 point perspective through each other. The two perspective drawings by observation turned out quite well in words of perspective. This is partly a result of choosing a focused, small framing, for which I used the view-finder. The two perspective turned out best in my opinion since not too much is happening while there is still and interesting subject (or two). It may have been good to place one of the subjects, the person, a bit more in the centre to catch more attention.

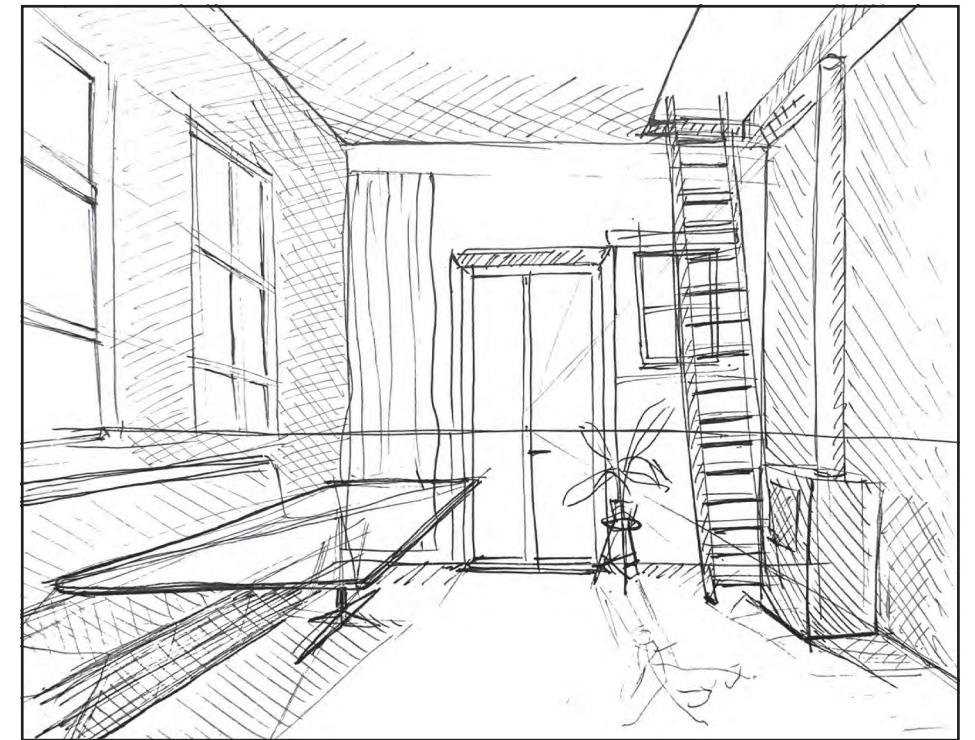

Drawing by Observation, Two-point Perspective - Living room

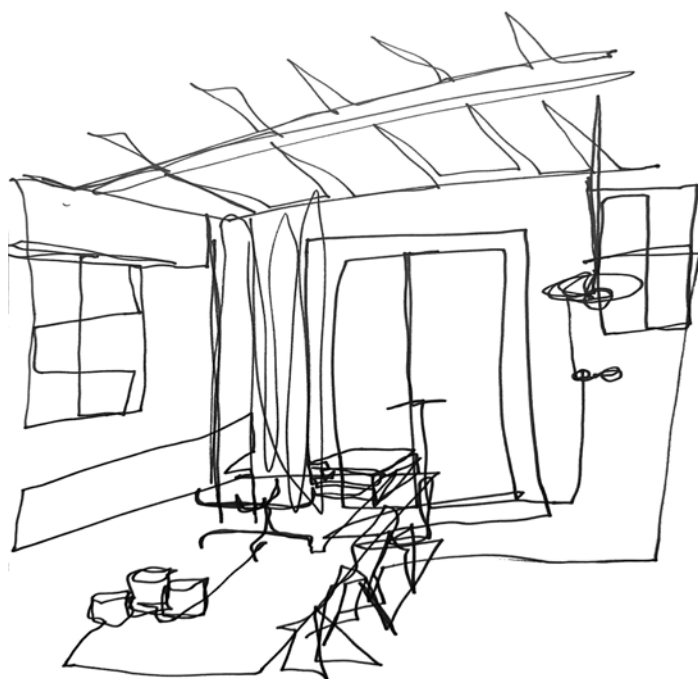

Drawing by Observation, One-point Perspective - Living room

Conclusions - Homework

The blind drawings that are more focussed turned out best again (2&4). When trying to capture a bigger space (1&3), the space looks either very cramped or very wide. The two point perspective looks very cramped as a result of the vanishing point that are too close to each other. The one point perspectives could have turned out better if the vanishing point would be more off-centre. All perspective drawings can use a bit more toning.

Drawing by Imagination - Living room, Den Bosch

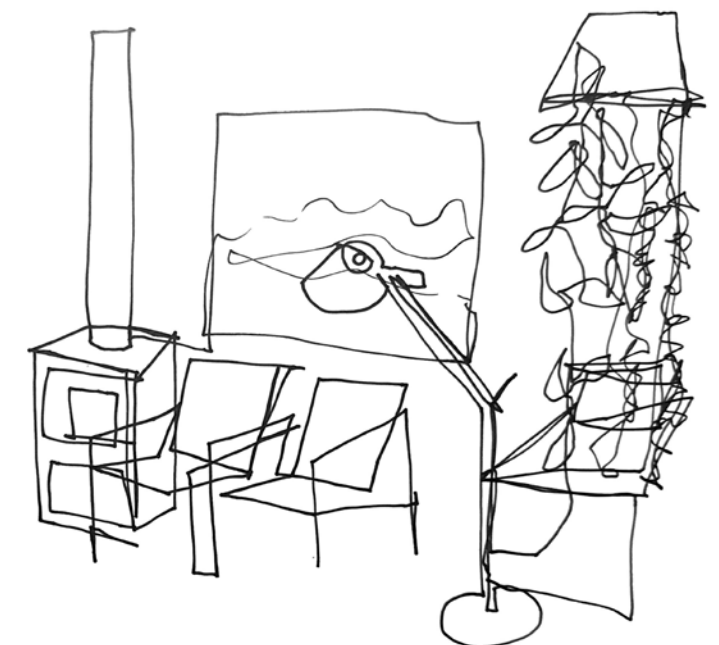

Blind Drawing 1 - Total living room, Den Bosch

Blind Drawing 2 - Full corner of living room, Den Bosch

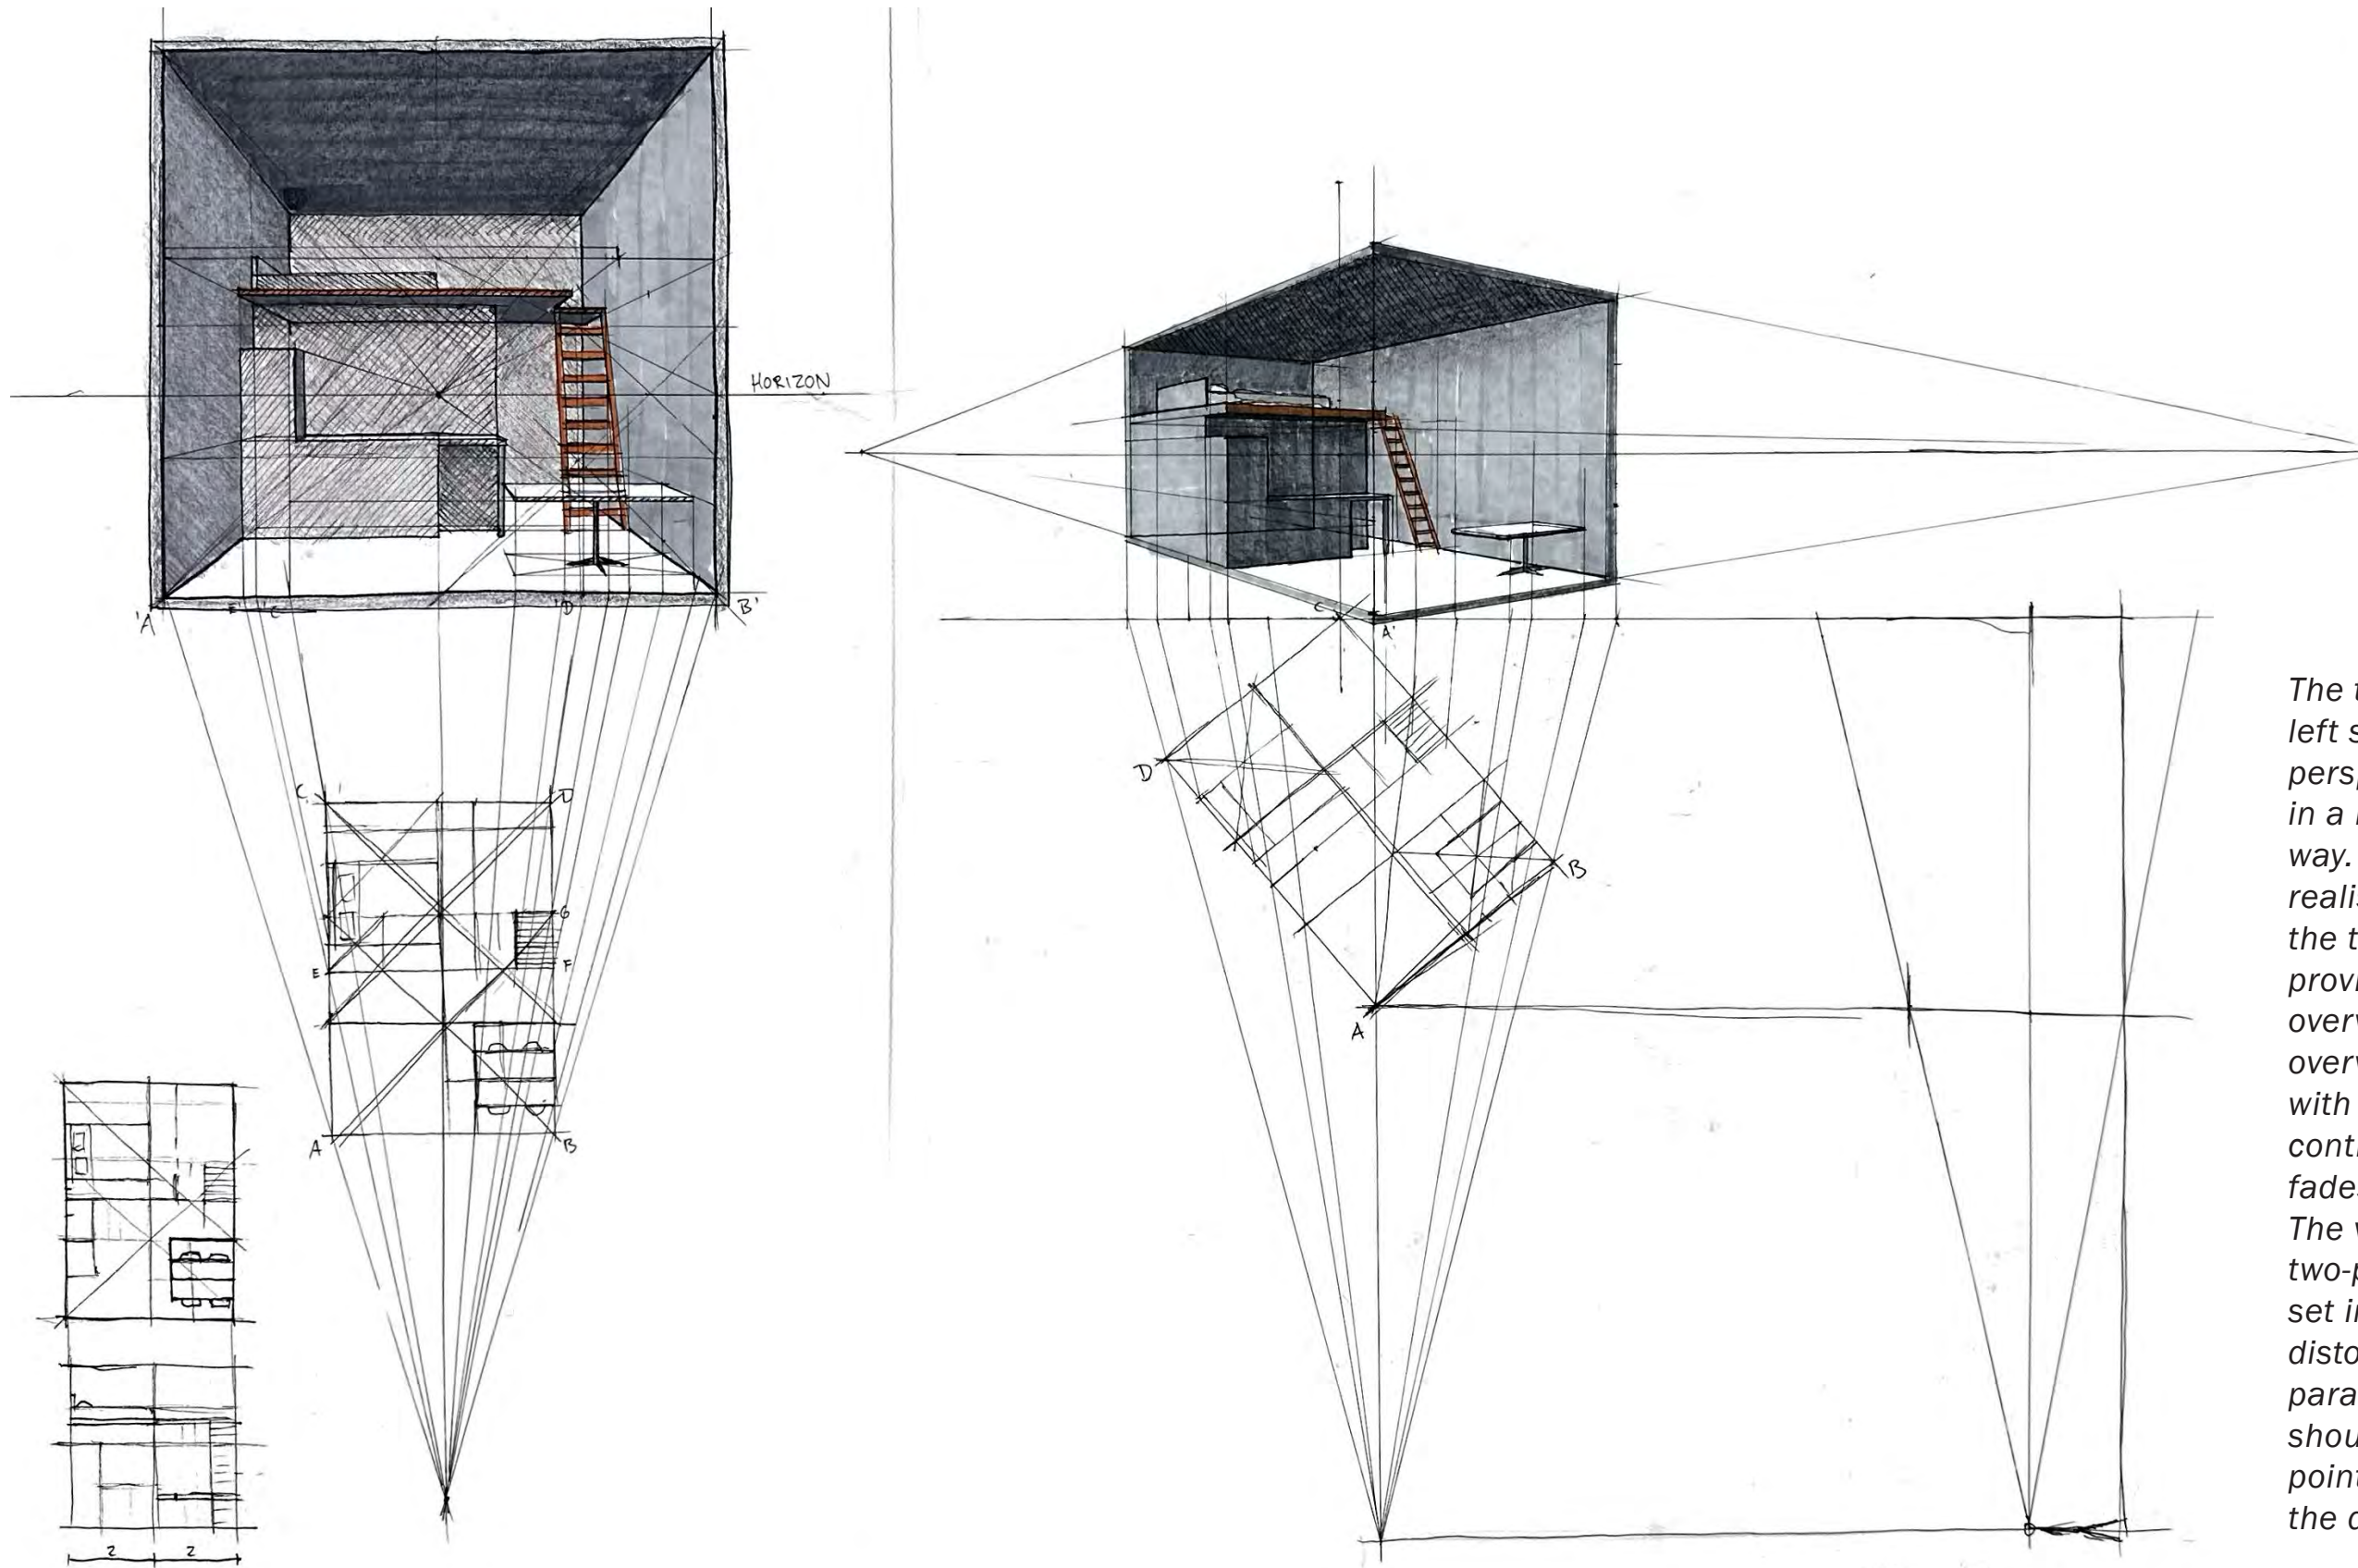

Blind Drawing 3 - Living room, Den Bosch

Blind Drawing 4 - Sitting space living room, Den Bosch

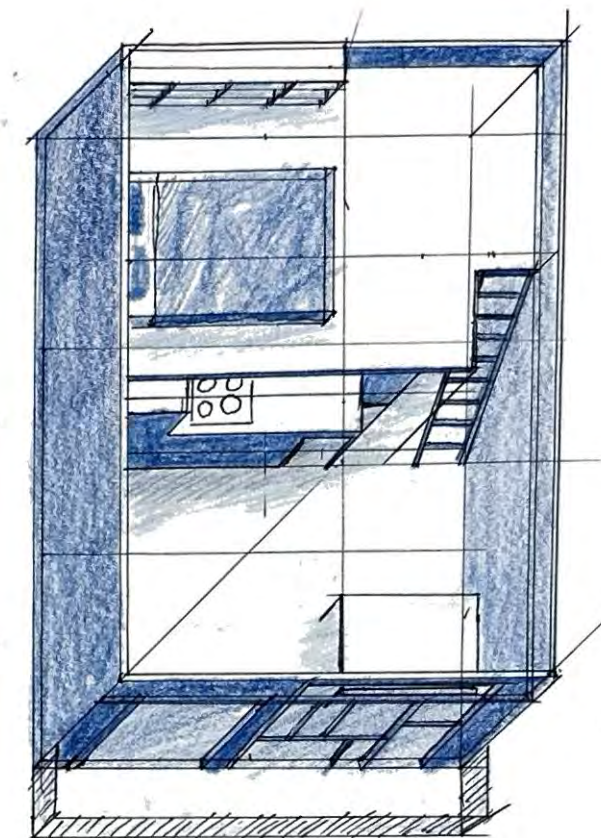

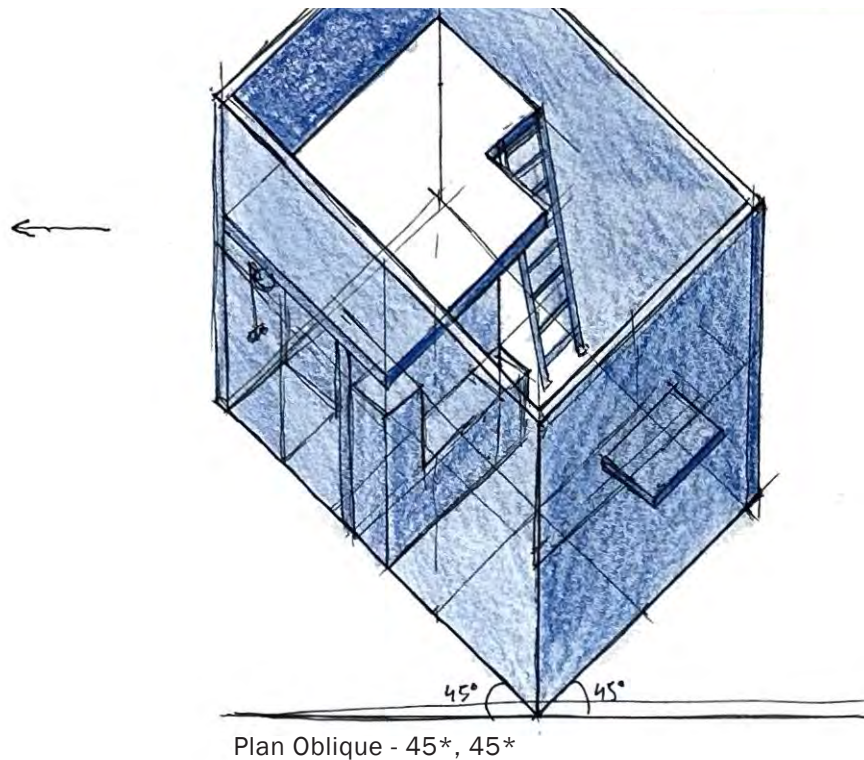

Assignment 2 - Drawing Systems

Assignment 2 is focussed on transforming 3D space into 2D images by imagination. It includes an overview of different metric and perspective drawing systems, drawings and images made from a particular space.

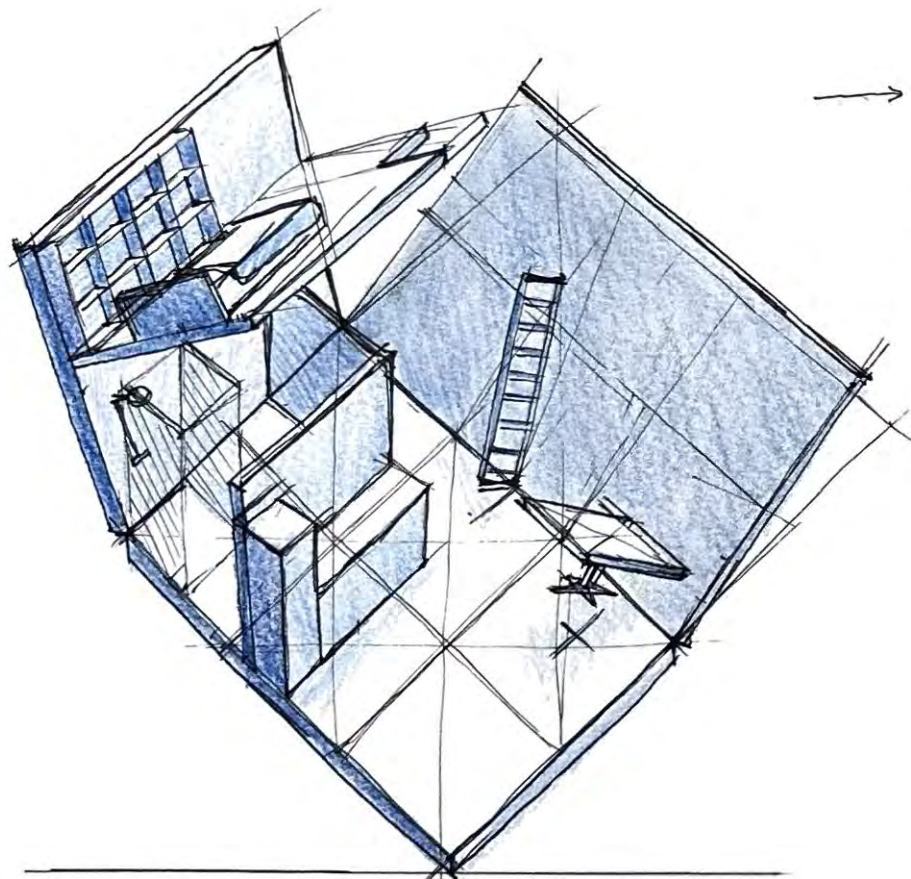

The two drawings on the left show two different perspectives, constructed in a relatively analytical way. The first offers a realistic viewpoint, while the two-point perspective provides a clearer spatial overview. However, this overview could be improved with stronger tonal contrast, as the kitchen fades into the dark areas. The vanishing points in the two-point perspective were set incorrectly, causing distortion; next time, lines parallel to the oblique plan should define vanishing points placed farther from the drawing.

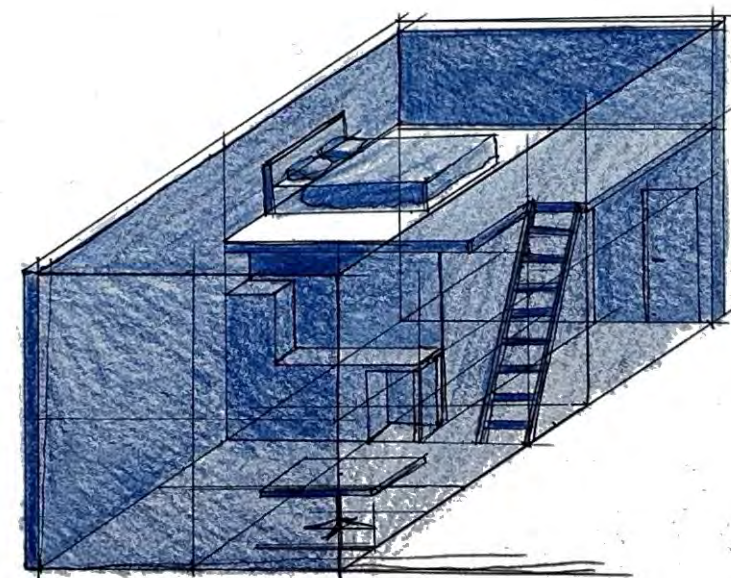

Looks more cramped, less spacious. Since you look from a high point of view, you feel further away/disconnected from the space.

→ This is a very different view from what we normally experience in the room. It does clearly show the placement of interior and the walls (since it comes close to a plan). However, it is more difficult to 'feel' the space because of the height that is hardly visible. This method could be used as an alternative of a plan, when still aiming for some more insight of the space.

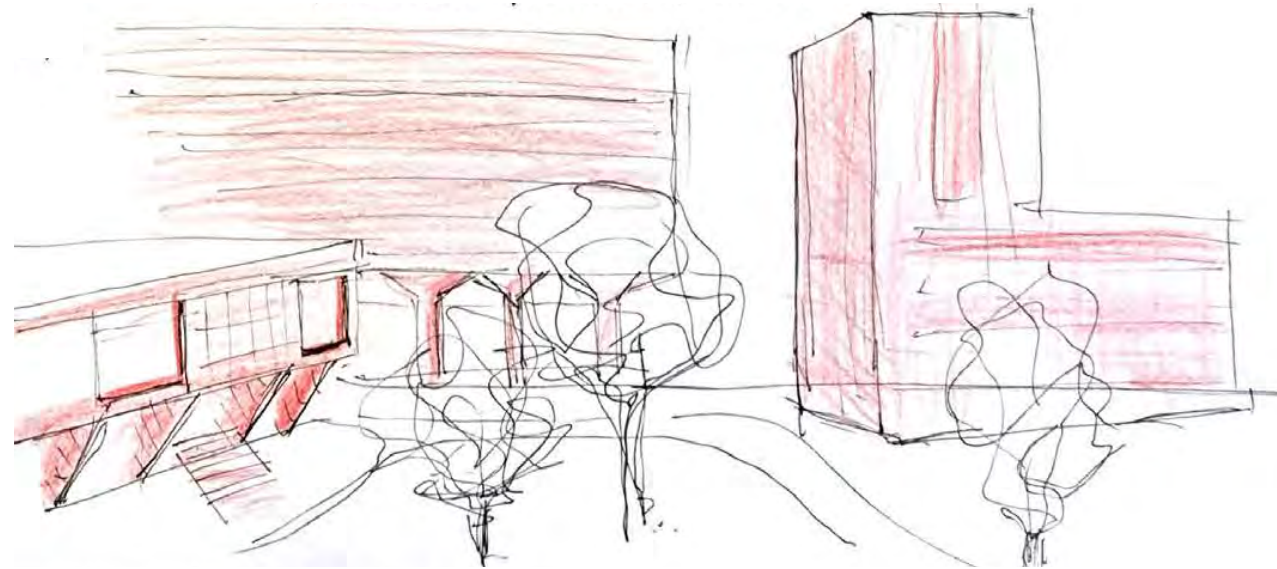

→ A bit confusing (partly because it is less neatly done), but it does show all the spaces and furniture. You get less of a feeling of the space because of the oblique walls and interior. The real connection between these space defining elements is not visible.

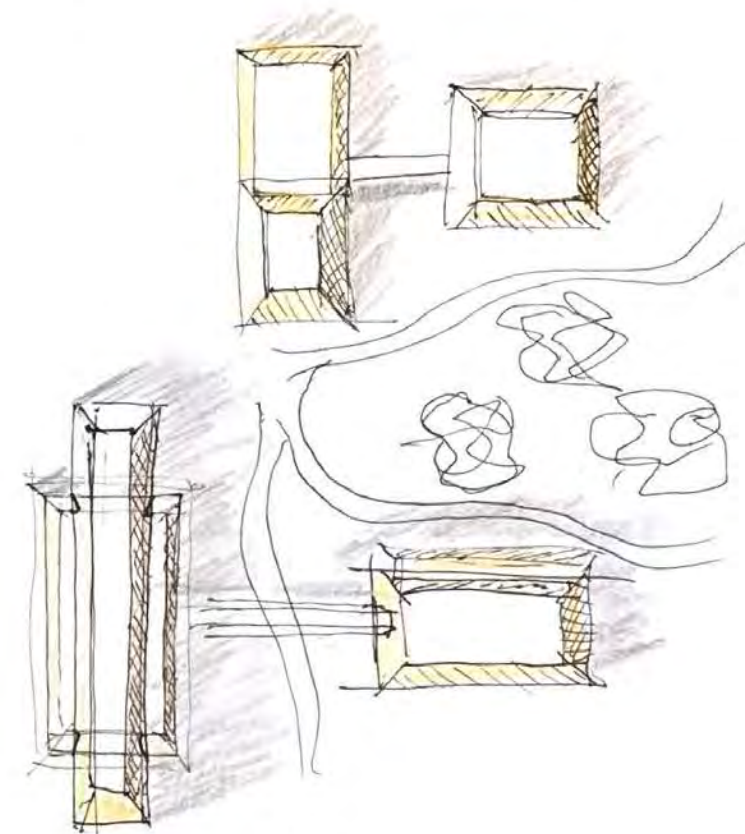

→ This Cabinet makes the space look very deep/stretched. This is caused by the absence of perspective in which the distance on paper gets shorter 'further away' from the viewer. This shows how used we are to perspective with vanishing points.

Assignment 3 - Mapping Space

In assignment 3, I experimented with mapping a certain space, a part of the TU/e campus, in different ways. It focusses more on mapping experiences and feelings, rather than on dimensioning the space in standard units. At the first page you see how I tried rationalizing the space in different ways. The second page is more focussed on visualizing personal feeling and experience with the space

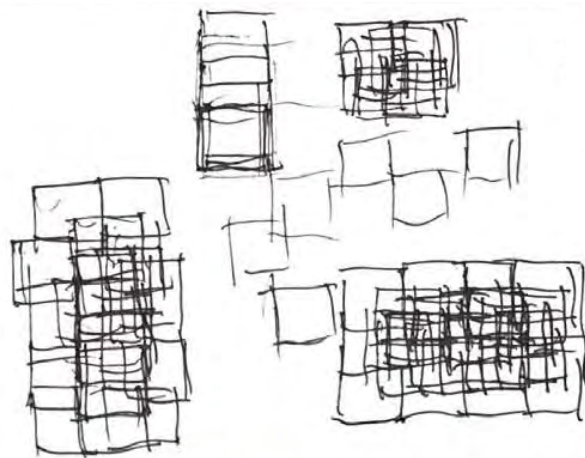

Imaginary drawing how I feel like the the buildings relate to eachother without thinking about perspective and direction of the buildings.

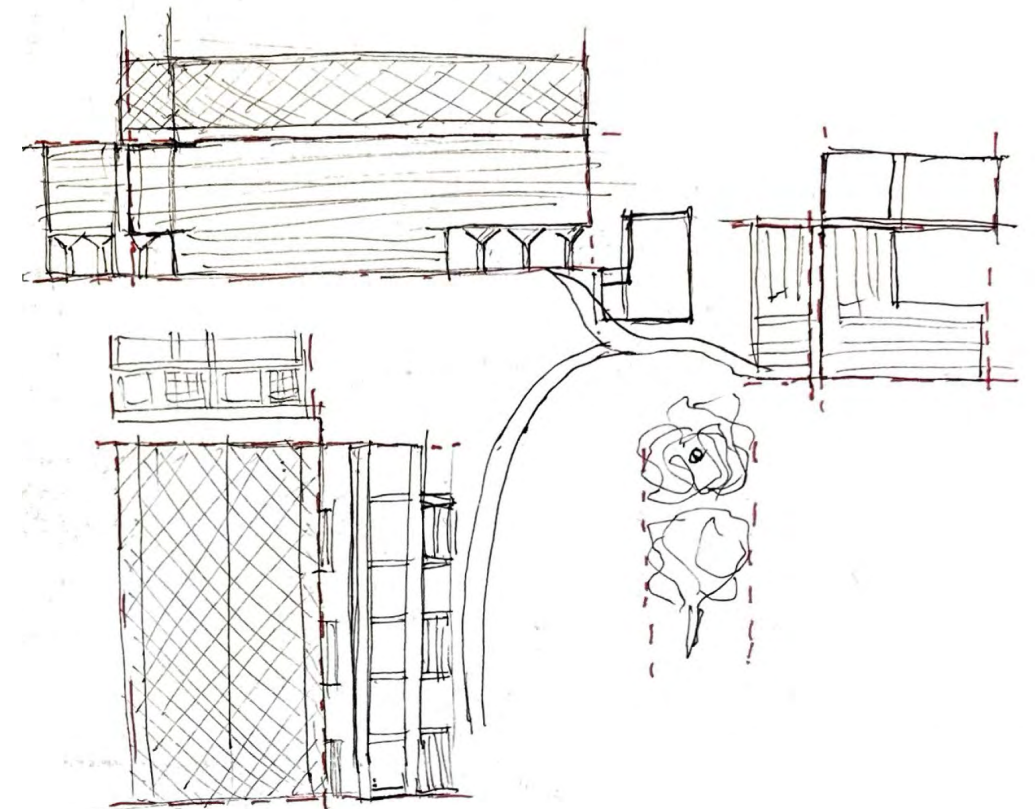

This top view includes seperate 1-point perspectives for all buildings which creates a special way of showing heights. If the cast shadows would have been worked out a bit more carefully, they could have helped more with showeing the heights.

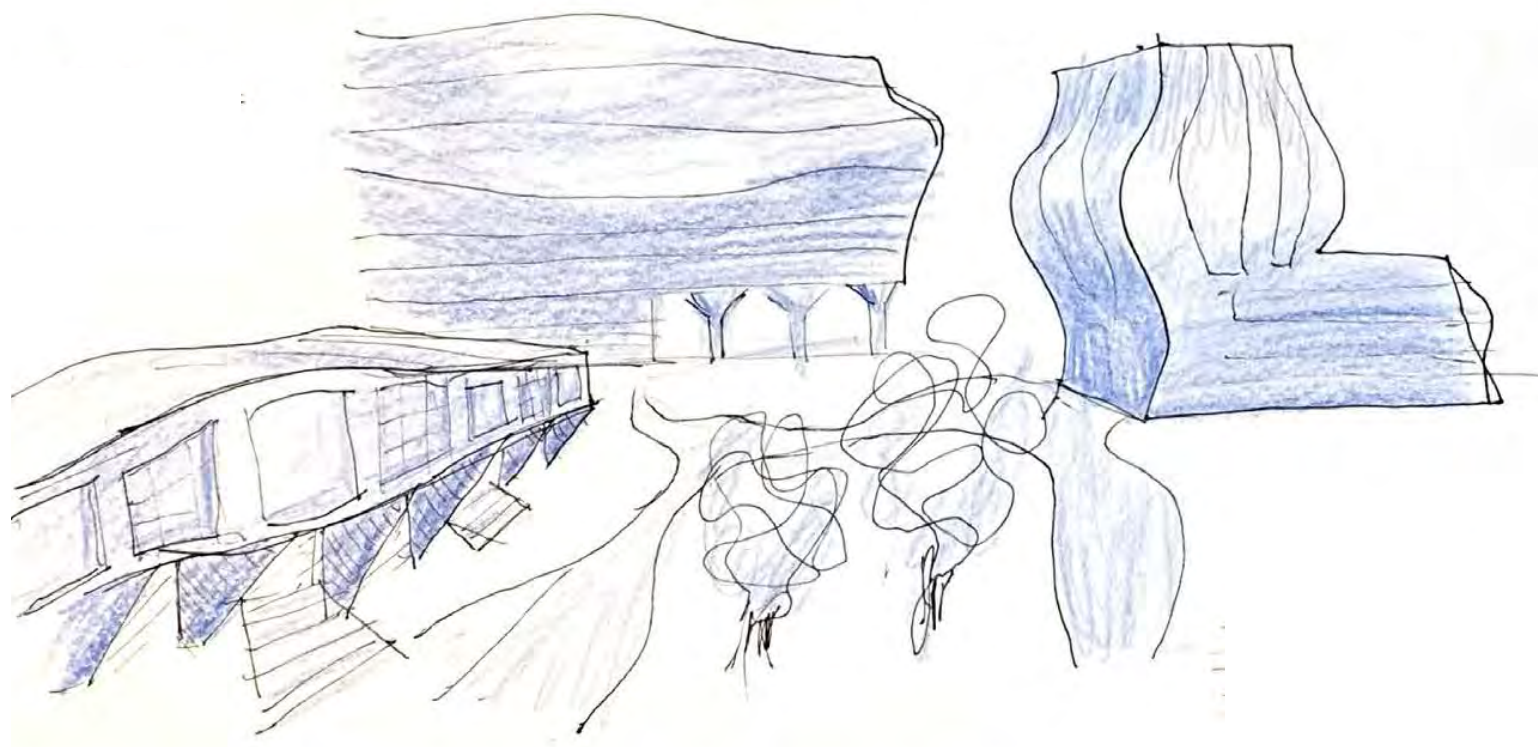

I tried to visualize the three buildings on their main shapes using only rectangles.

This plan is shaped by squares of the same size, based on the size of the tower part of Vertigo.

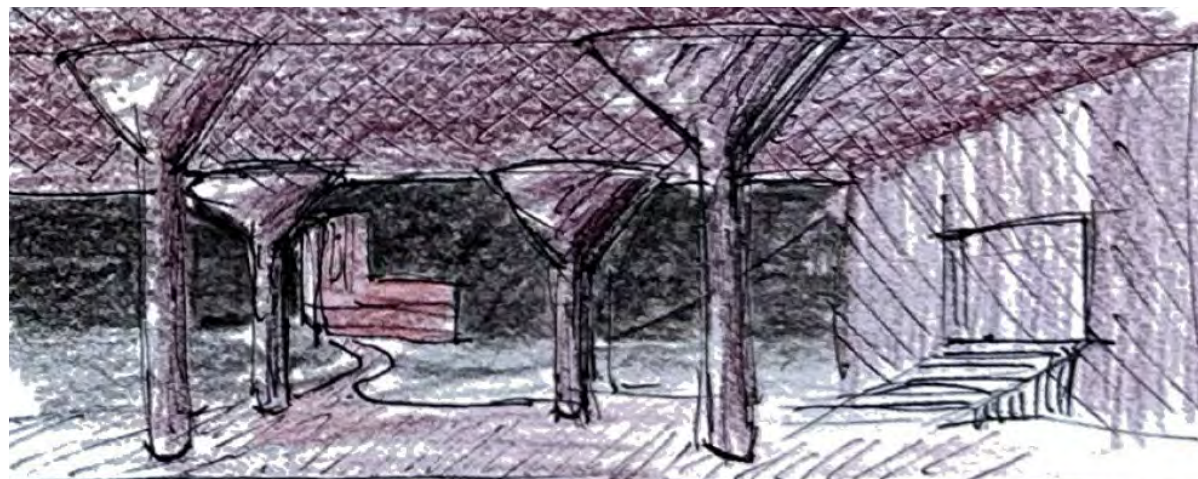

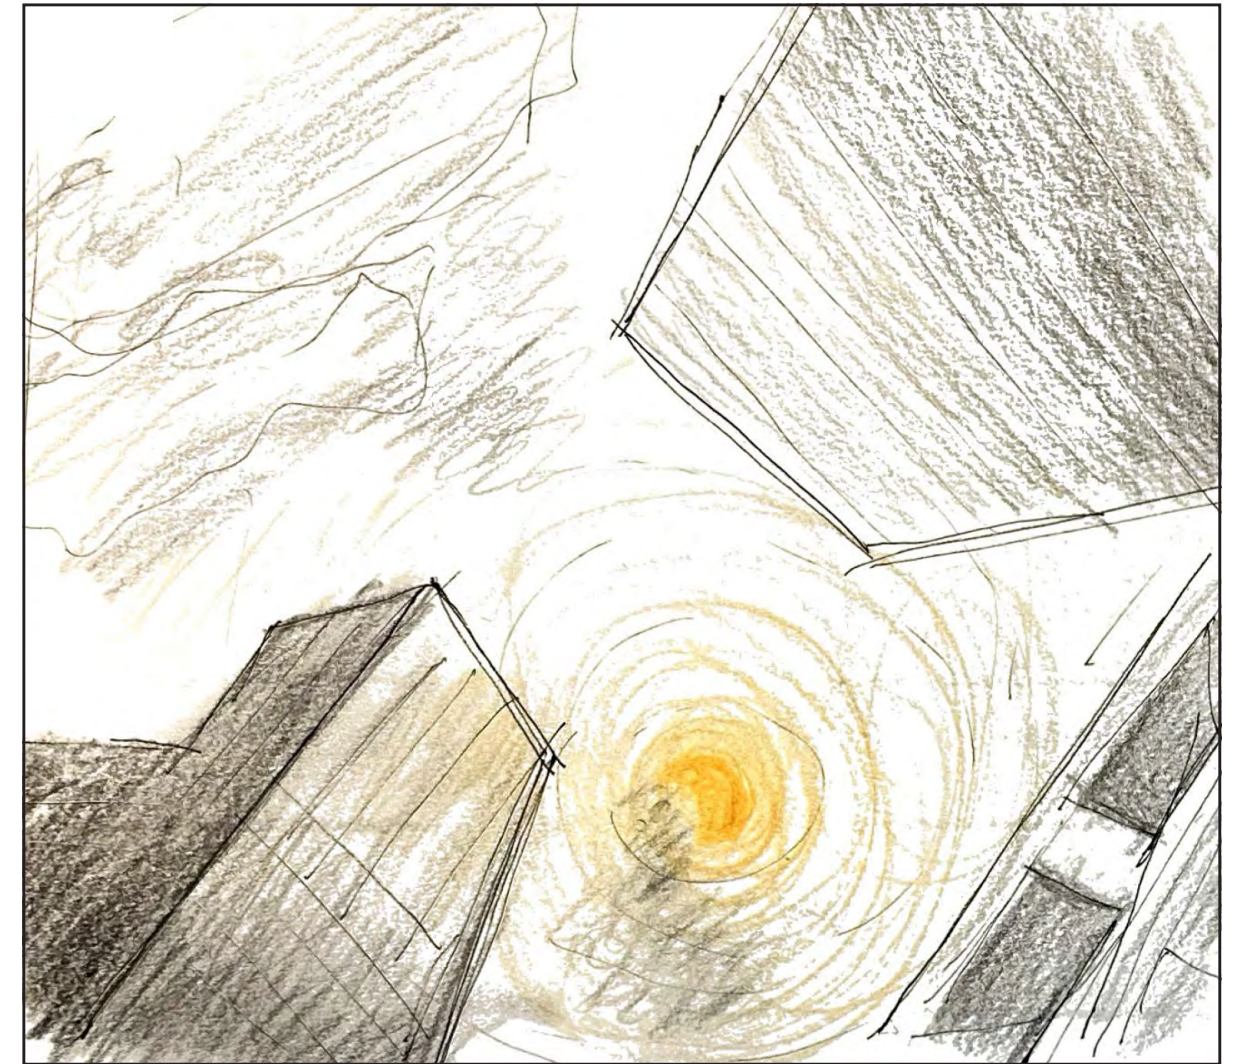

This is a combination of elevations (top, front and side), which look on their own very measured (Cartesian), but the relation of the buildings to eachother as put together here does show the spaces in between in an unconventional way.

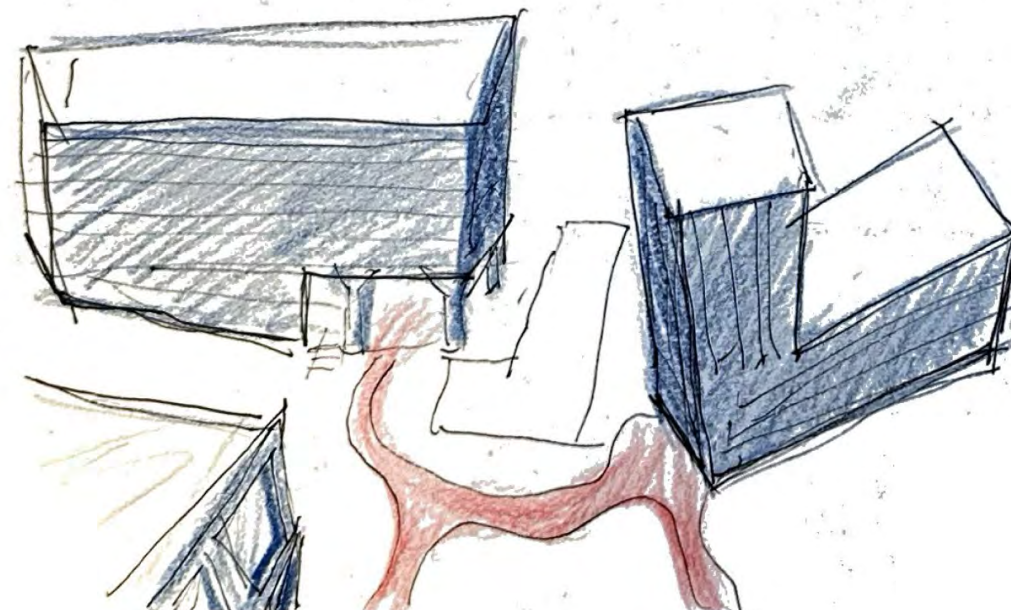

In this drawings, the sizes of different parts of the buildings are based on how often I visit the space (and here the amount of information I have about the specific space).

The drawing show what I imagine seeing when looking up in between the buildings. The atmosphere is very intimidating, it feels a bit like the buildings are looking down at you.

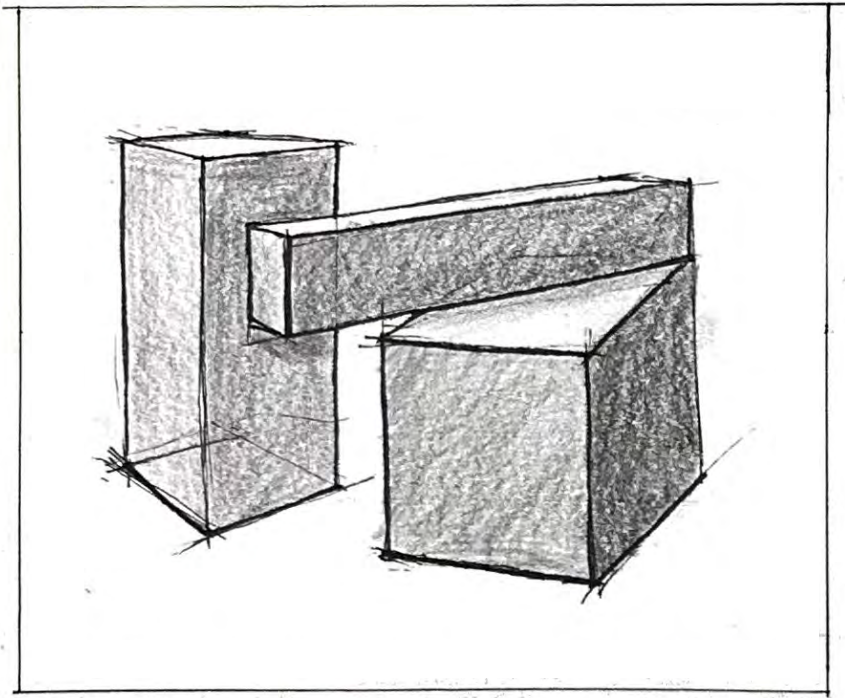

This drawing shows in a dramatic way what the route from Metaforum to Vertigo feels like on a bad day.

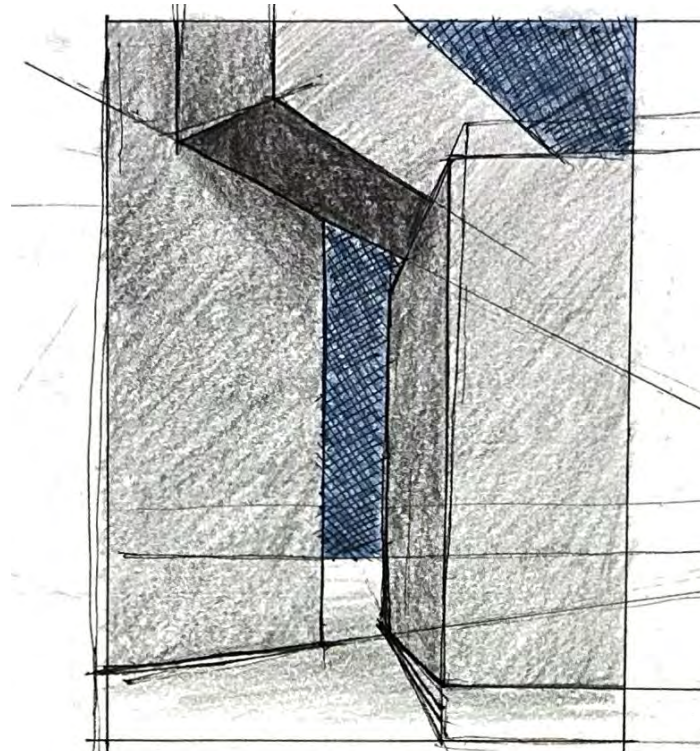

In this drawing, I did not care about the size and orientation of the building, I tried to focus on the relationship between the buildings.

Assignment 4 - Portraying & Framing

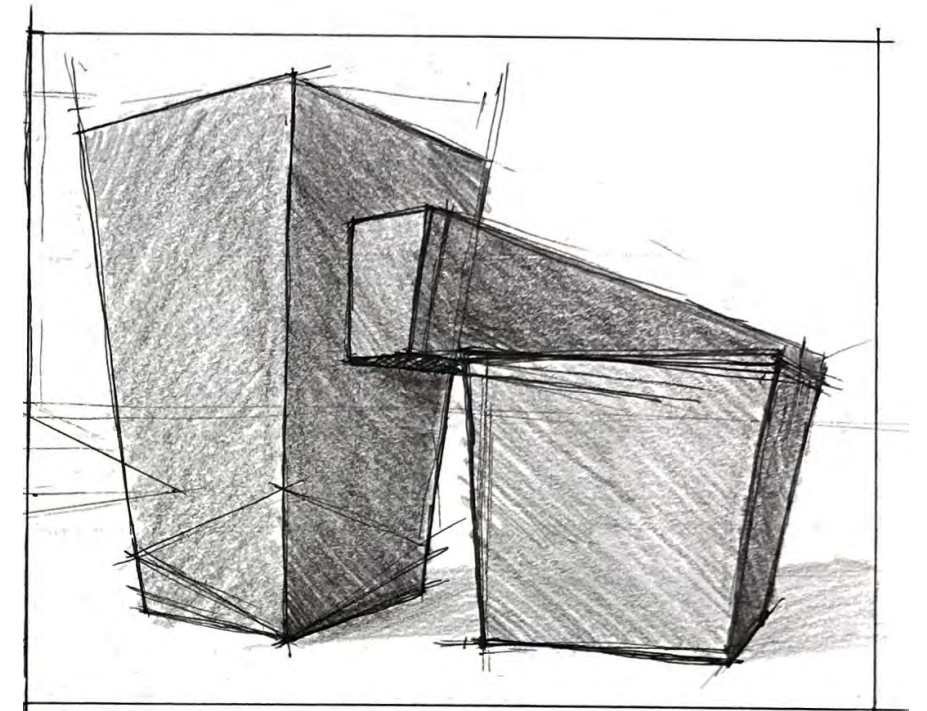

This Assignment includes a set of drawings in which different framing and perspectives are tried out. This results in very different atmospheres and feelings connected to the object or space. On the first page, drawings of small boxes can be found while the second page shows the big atrium in Vertigo.

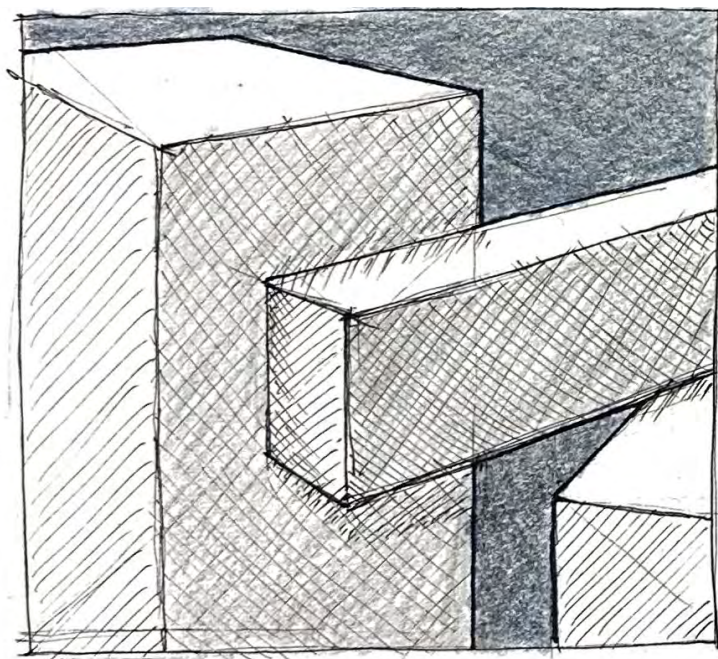

This birds eye perspective creates a distant, objective view of the object which looks relatively small.

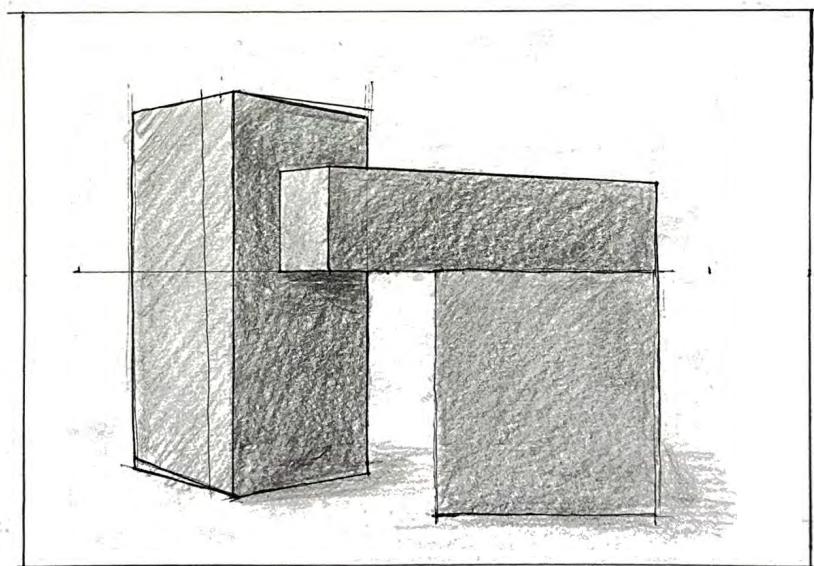

The low viewpoint creates an imposing and intimidating atmosphere. It makes you feel small

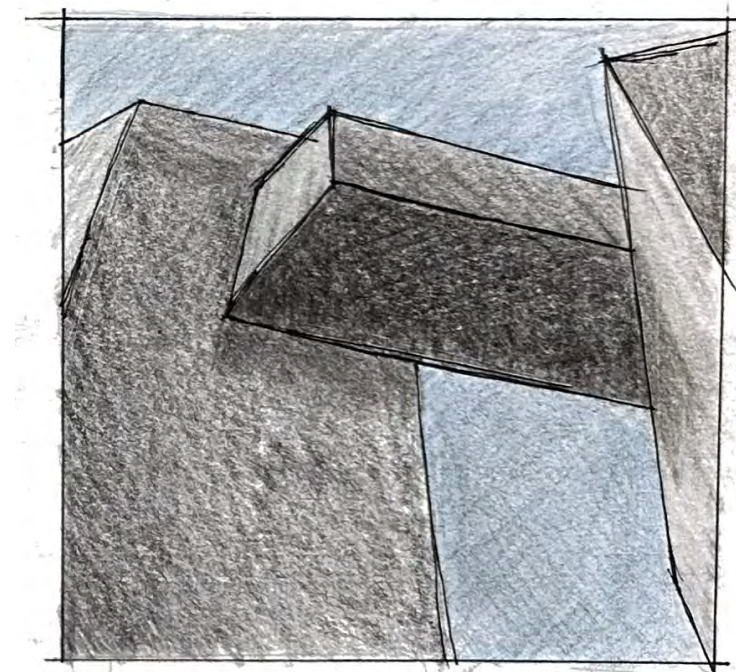

This perspective is a bit confusing since the building gets bigger when going up (third vanishing point below the drawing). It creates a playful and dynamic picture.

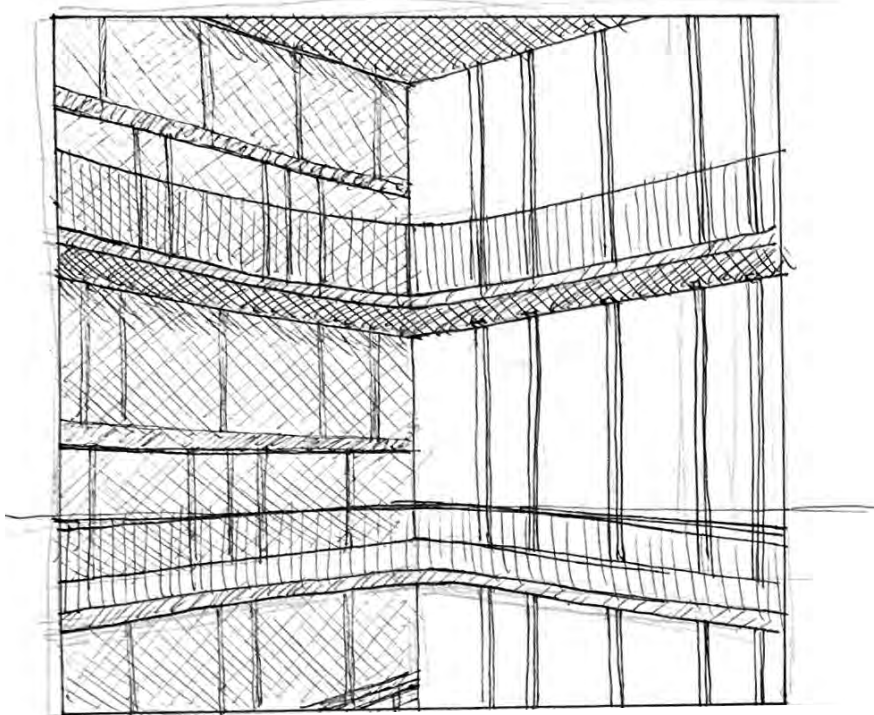

The zoom and framing creates a focussed and quiet view. The diagonal lines make it more dynamic

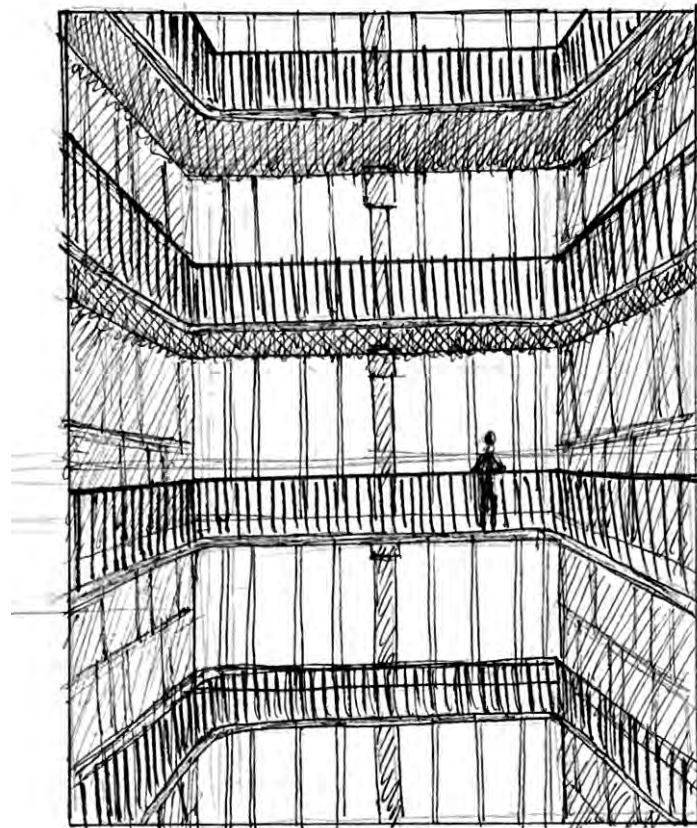

By placing the viewing direction perpendicular to the main block and aligning the horizon with the main line, a simple, static picture is created.

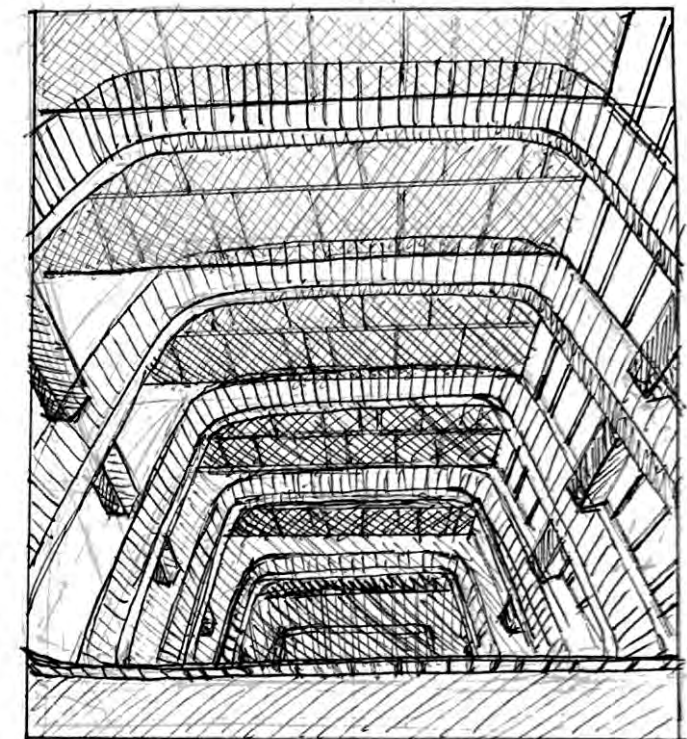

The extremely low horizon (looking up) and, third vanishing point (up) and the shadows result in a very imposing and even intimidating view.

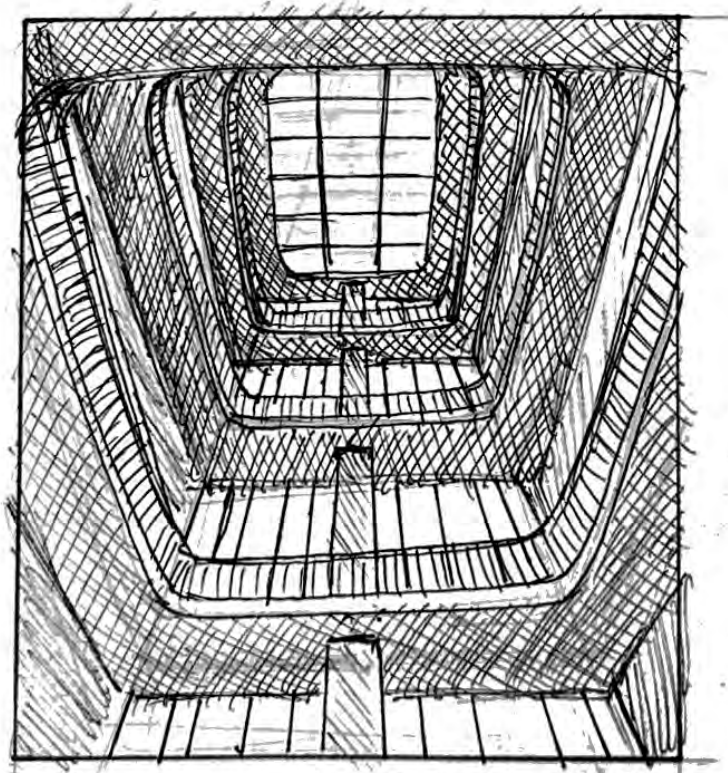

The two sides of the void are symmetrically divided which creates a neutral composition. This is also enhanced by the square framing (no direction). The two vanishing points are equally far away from the middle which also creates neutrality.

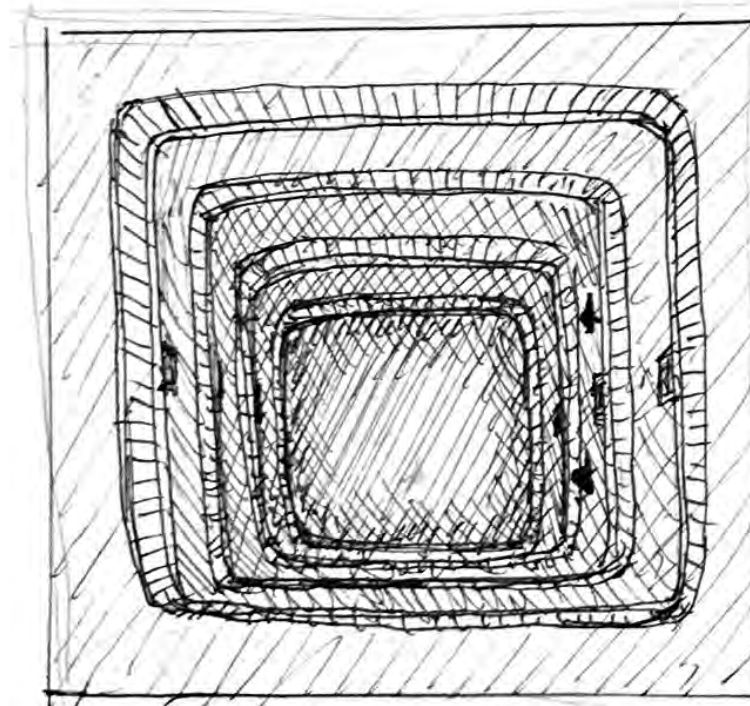

This symmetric one-point perspective creates a powerful, controlling impression, drawing attention to the central column. The vertical framing and the person emphasize the scale of the void, which is heightened by not showing its top or bottom.

This looking down, top view of the atrium has a vanishing point just under the drawing, which makes the space look extra deep/high. You almost get dizzy (Vertigo) of looking over the railing. It makes the drawing dramatic and daunting.

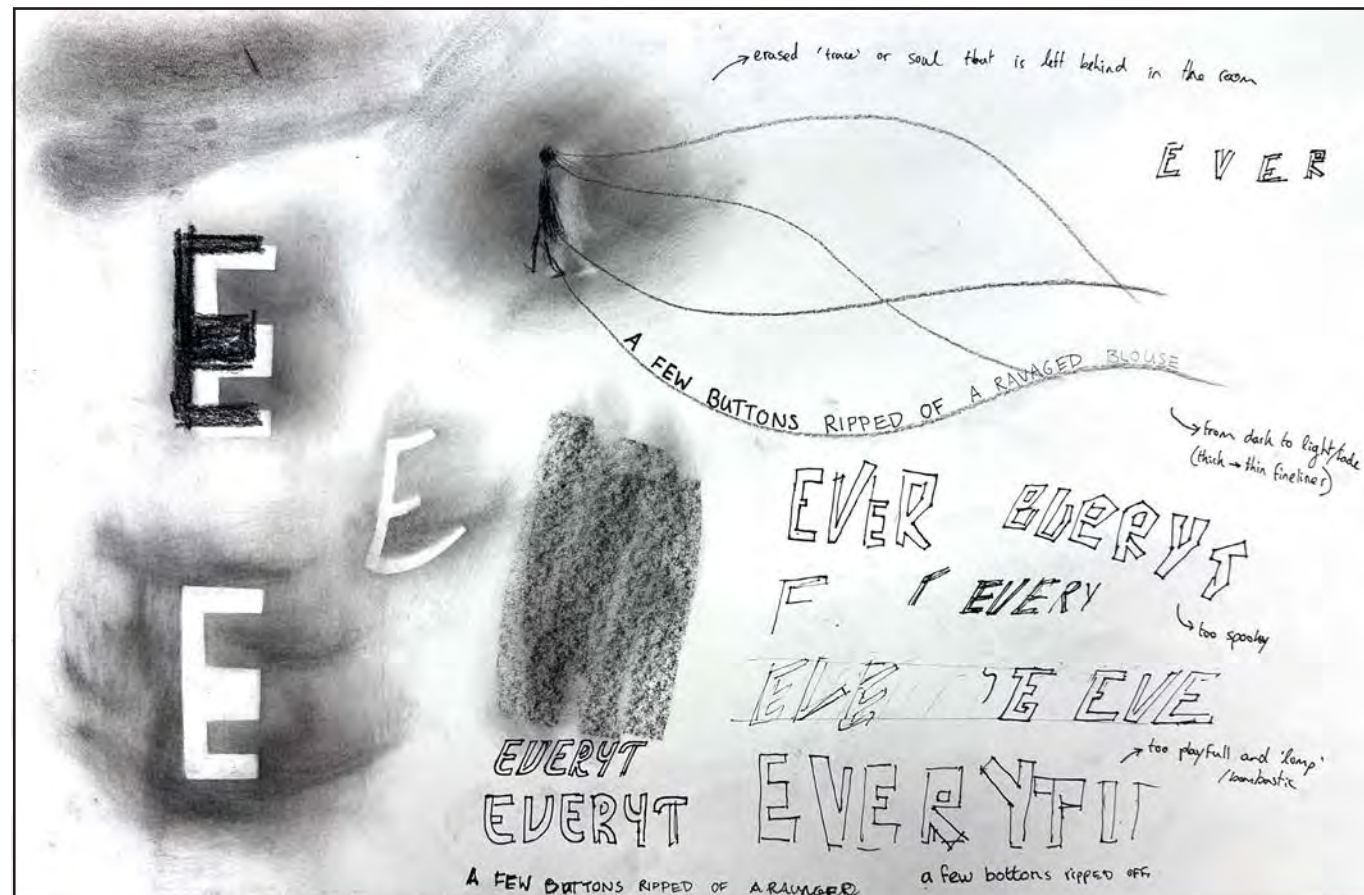

This looking up perspective drawing gives an overwhelming feeling, created by the strong perspective in vertical direction. The perspective leads the eye of the viewer towards the skylight.

This top view has a vanishing point almost in the middle. Both constructed (two-point) perspective and the atmospheric perspective (darker deeper in the drawing) is used. This creates a dramatic effect but is also quite distant since it is not a very realistic point of view and hereby not close to the people.

Assignment 5 - See & Write

Assignment 5 is about designing a typographical poster of a poem. It is not only about choosing the right font, but also about a fitting composition and possible added visuals to enhance the content of the poem as good as possible.

The process of this assignment consisted of different parts.

It started with an choosing an interesting poem that fits my theme of the seminar: traces. I found a poem that described how everything (and mostly everyone) leaves traces behind, with a lot of beautiful examples. I used some of the sentences from this poem and added some more.

Next, I started thinking about ideas for material use, composition and letter types. I came up with the idea of using stamps or the opposite thing of stamps: masks. This would be in line with the idea of 'leaving a trace behind'.

I experimented with charcoal and paper masks to create the main sentence of the poem 'everything leaves traces behind'. The word 'trace' would get more attention by leaving sticking the masks itself, a little bit shifted, on the paper. This also reveals the working method.

The overall feeling I wanted to convey is darkness, sadness, and drama, inspired by the poem's sense of loss, the emptiness left by people who are no longer present but who have left traces behind.

I arranged the sentences describing these traces in a disordered way and let them fade out, echoing how traces themselves gradually disappear.

The figures connect the traces to their source: the people who left them. The figures themselves also cast a faint shadow, a trace of their own.

on the next page, the endresult is visible.

EVERYTHING LEAVES IT'S TRACES BEHIND

A name half-erased in steam on the bathroom door than the rest of the wall

A shadow where a picture once hung, pale mirror in a vase

A bit of fresh fragrance waiting in the wilted roses

Biked-over ripped off a tattered blouse
A few buttons grass that never quite straightens again

A bit of dust sticking to the inside of a hat

A cup ring blooming slowly on an old wooden table

Fingerprints of flour elsewhere like small moons

A peak bent polished smooth by years of windows

A swing hanging once more after the wind stops

Cup marks whitening the sidewalk

A crease in the pillow that refuses to smooth out

Assignment 6 - Tone & Shadow

Assignment 6 includes a set of drawing studies about toning and shadow. Different materials, techniques and lighting are tried out to find out what influence it has on the drawing.

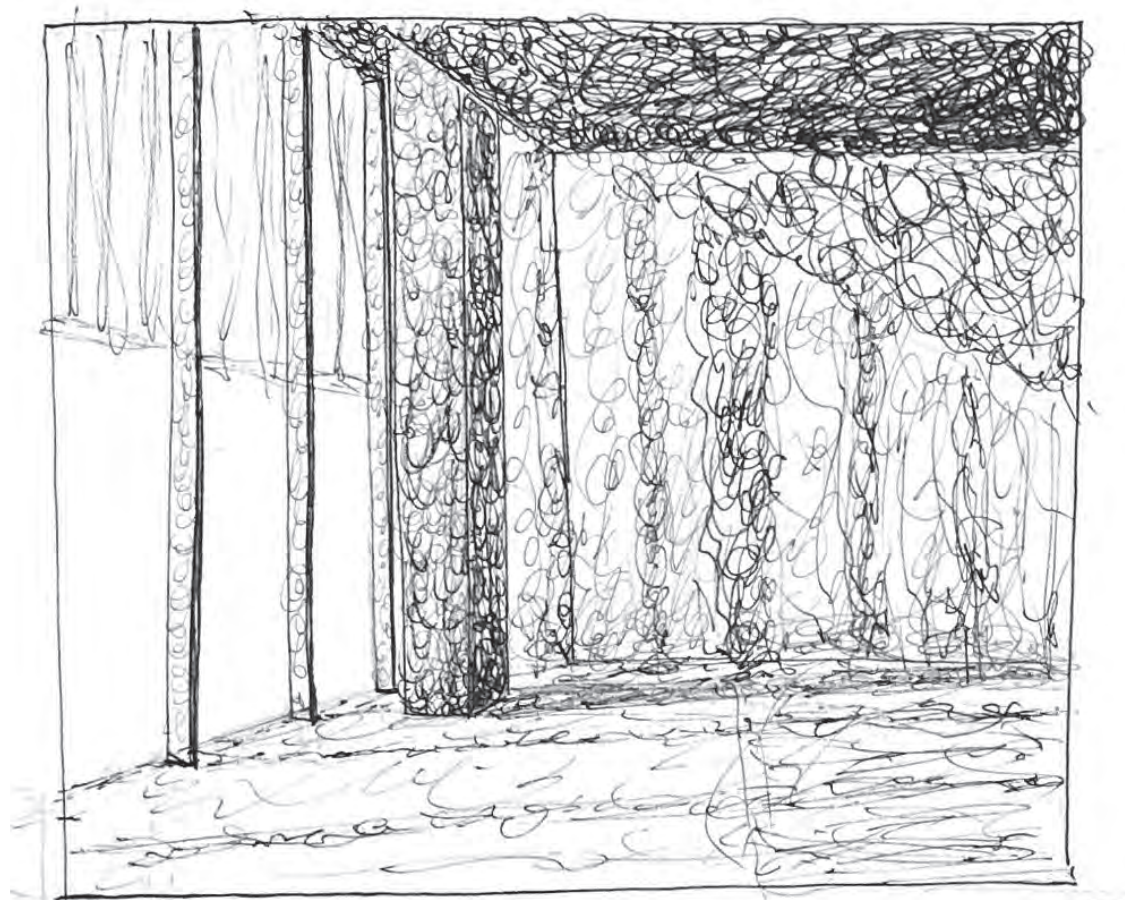

The harsh distinguish makes the relatively simple situation look very dramatic. Even though only black and white plains are used, the different textures (oa fabric) are recognizable.

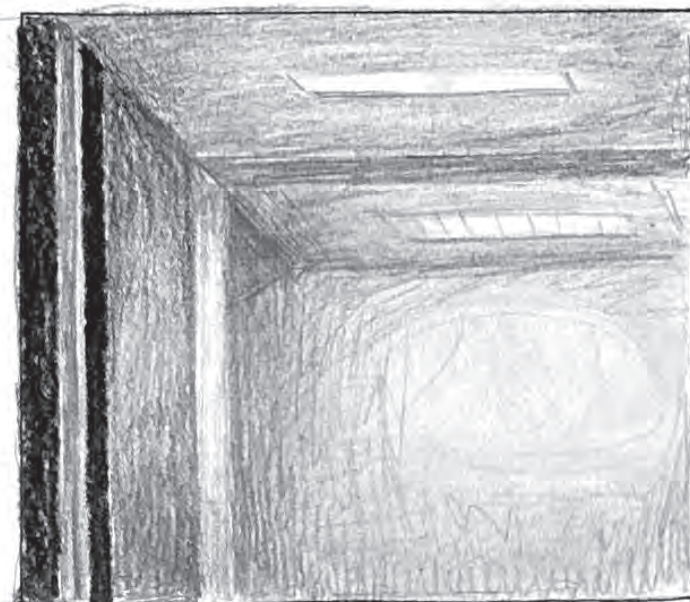

The black background and the shadows on the ground make the whole scene even more dramatic. The diagonal lines on the floor but also in the composition as a whole makes the picture more dynamic and interesting.

This dramatic charcoal drawing is detailed yet rough. The contrast between foreground and background comes from differences in sharpness/blending, while the vignette draws the eye to the center and heightens the drama.

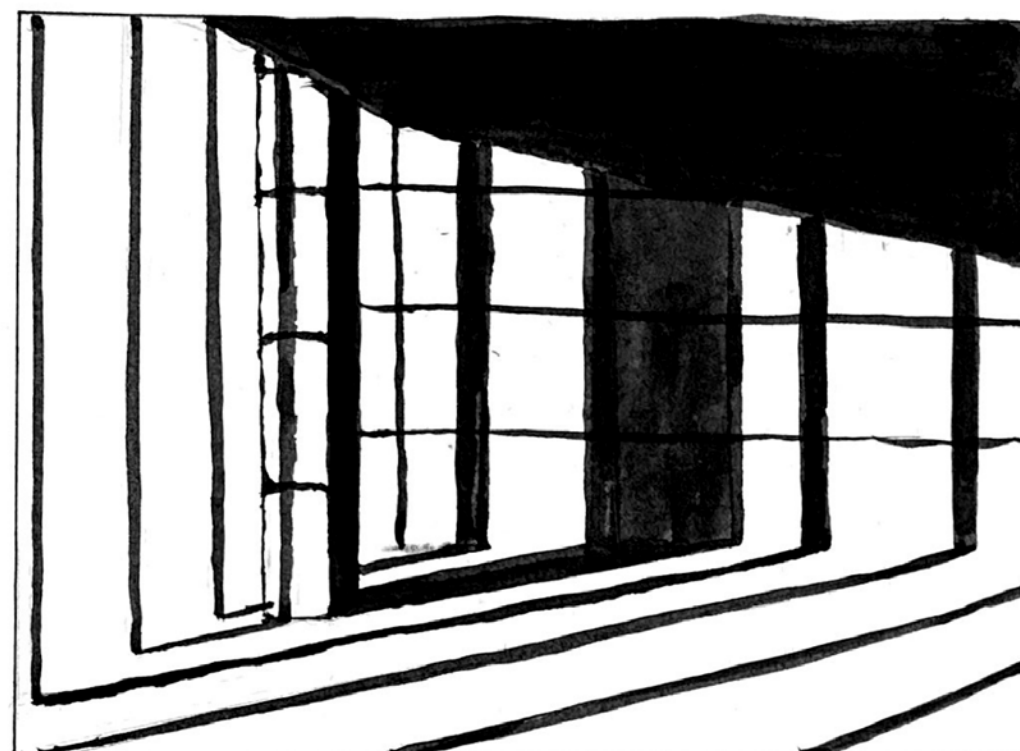

This drawing is made in Vertigo. The light comes in via the high windows and creates shadows on the wall. The shadows make it more dramatic but it is more diffuse and has more nuance than the black-white version on the right.

This drawings brings attention to the artificial light when it is dark outside. Both the framing and the way of using pencil creates a diffuse, neutral atmosphere.

My eyes caught this escape sign which has very bright small lights in the border of it. The way of using different pencils (HB, 4B, 8B) made the sign pop out more clearly.

This very dramatic atmosphere is created by the diagonal lines, created by both the diagonal shadows on the floor and walls as by the harsh contrast between black and white.

Assignment 7 - Form-Residual Form

The last assignment is focussed on the contrast between form and residual form. It includes both studies with a small object as with bigger, architectural objects.

This first drawing makes it fairly easy to distinguish foreground from background. Not only the different tones, but also the zoomed out framing gives us an overview of what is actually happening. The challenge of the next drawing is to find the edge of recognition in what is background and what is foreground.

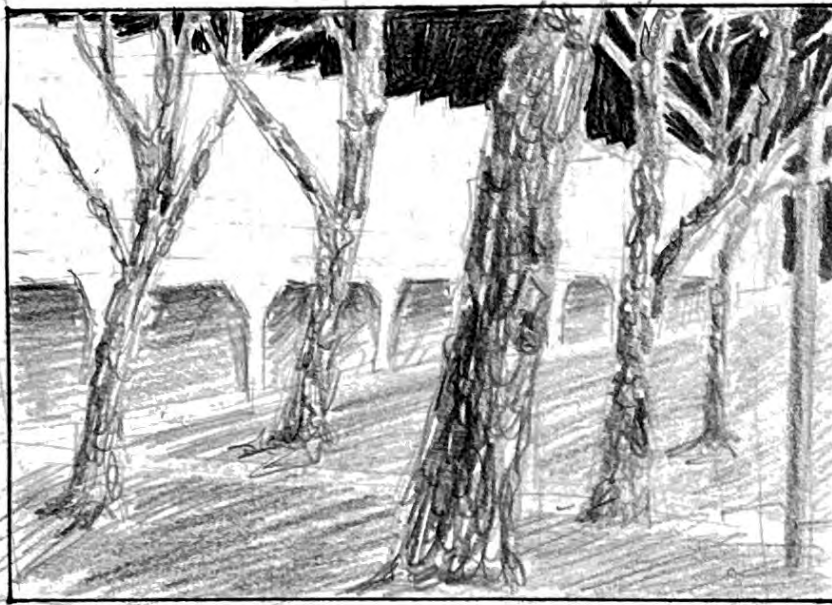

The object, an iron, is pushed away to the upper side of the frame and creates a division of 3 sections together with the two shades of grey (the end of the table). The object is difficult to recognize. In addition, the composition feels a bit awkward since the object is not centred and cut off.

In this drawing, there is a circa 50/50 division of either black or white, which makes it difficult to see what is the object and what is the background. You may be able to recognize some kind of object in both the black and the white area. Since the silhouette (of the old iron) is not very well known, it may be difficult to see it. The diagonal lines/directions and change from black (left top) to white (right bottom) creates tension and dynamic.

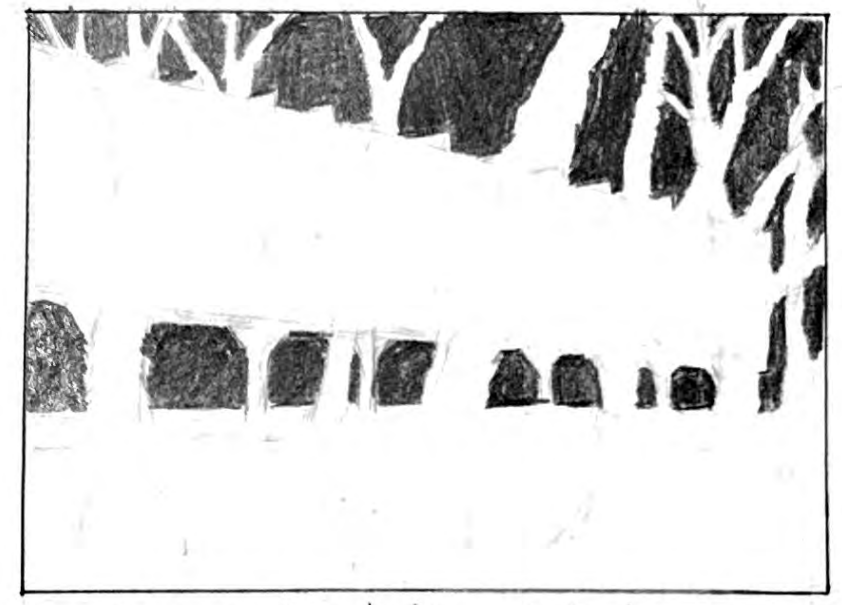

This drawing has a similar composition as the black and white drawing above (ca 50/50 background and object division and dynamic directions of the edge of the object). However, the extremely colourful, patterned background catches a lot of attention which makes the object (white) a secondary element of the drawing.

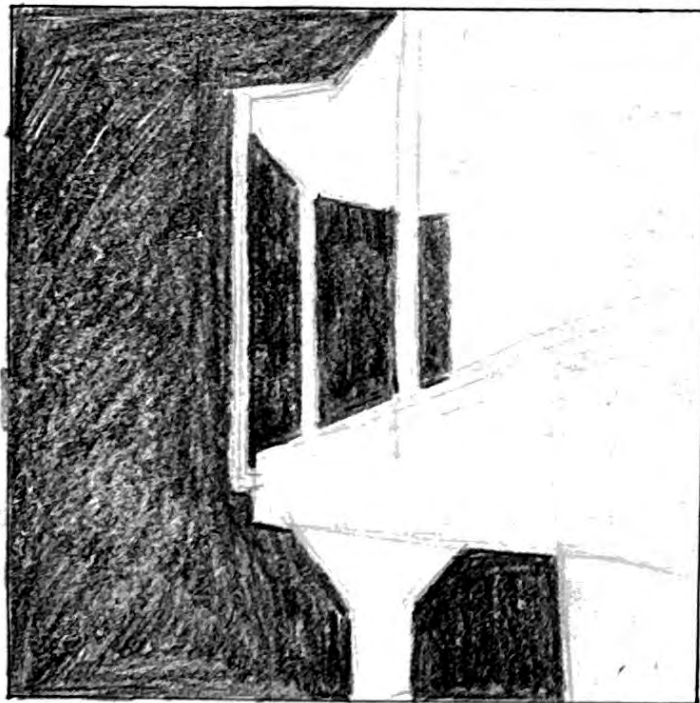

The repetition of the building is still visible in the surrounding matter. Even though the trees in front of this rhythm, it is still easy to recognize a building or even specifically Neuron in it.

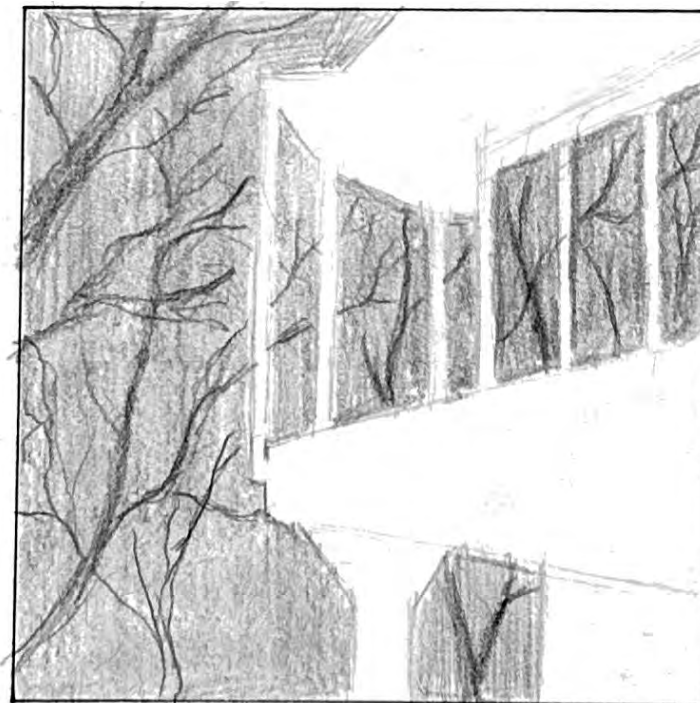

In this case, the Rhythm in the background makes sure that the irregular shapes in the foreground, which are removed, are still recognizable as trees.

In this case both the building and the trees are removed. These elements have such different shapes (organic vs repetitional/straight), that it is still possible to distinguish the different elements. Since we are very used to perspective, it is also easier to recognize some kind of building block.

In this zoom of the building, around 50% makes up the background and 50% the foreground. Without the context of the other drawings it may be difficult what is the object.

This similar composition has now more detail in the background. The trees make it more clear what is the background and what the object. The trees are also mirrored by the windows, but this is less clear.
