“001.”

This portfolio will showcase some of the projects and assignments i've been working on during my first semester during the BAU-studio course. These projects include our A, U and B projects which correspond with the different tracks that are available in our career as a built environment student. This portfolio also includes a selection of my media&skills projects, which were made using Adobe software. The final part consists of my handdrawings that I made for our handdrawing classes.

experience.

I have experience with several programs (Photoshop, Illustrator, InDesign and more, as listed on the left) and try my best to keep developing my skills.

I am also currently doing supporting work at an architectural firm, which includes tasks like measuring on site, making models in ArchiCAD and visualisations in Photoshop.

education.

**Pax Christi College
Gymnasium (NT/NG +economy)**

004. about me.

“004.”

I really enjoyed working on these projects. What I enjoy most is being creative and everything that involves designing. Everything in this portfolio is put together with great enthusiasm and care.

>>>A-PRO- JECT.

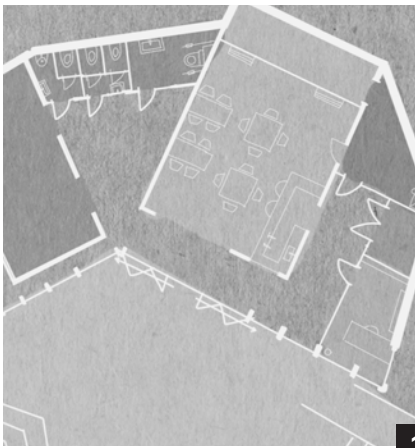

The A-project is the first project that will be showcased in this portfolio. This was also the project that I was most looking forward to.

For the A-project, we had to design a park pavilion or a community center for the people of Eindhoven. There were three plots we could use to put our building on.

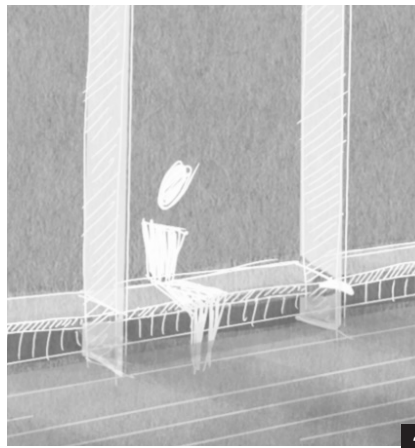

On the right, a schwarzplan i drew is shown. This schwarzplan illustrates the built vs the unbuilt space of the location we had to design a building for. It also shows the plots we could use in gray.

5

A.

When starting with the design, we had to first make some sketches. Since I wanted the community center to be accessible to everyone, the building should only be one floor. A clustered layout was chosen to make sure that the people can linger, and that it would not be a linear layout.

What also was an important design choice for me, was the amphitheatre layout of the terrace. I wanted to fully make use of the space that was used for the terrace. Therefore, the stairs can be used as stairs as well as seats. Not only the visitors of the building can sit here, but it also provides seating for the people playing on the playground. (see next page)

To further use that idea of a space to stay and linger in, I also wanted to incorporate bench-windows, to make maximum use of the circulation space. These bench windows are shown in figure 2.

Pictures.

1 Figure 1 shows the floorplan i designed for this project.

3 Fig. 3 shows an inside perspective of the exhibition space and features a glass roof in a grid to allow light to enter from the top.

4 Fig. 4 shows a close up of the model i made

5 Fig.5 illustrates a detail on the roof

A-project:

the design of a community centre

introduction

The aim of this project was to design a park pavilion for the people of Eindhoven.

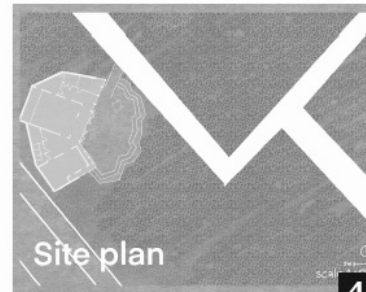

First, I decided on the main goals for this project:

- the building should be **accessible** for everyone.
- the building needs to be **inviting**
- the building needs to **add** to the environment (but not necessarily blend in)
- should have a **light and pleasant atmosphere** inside

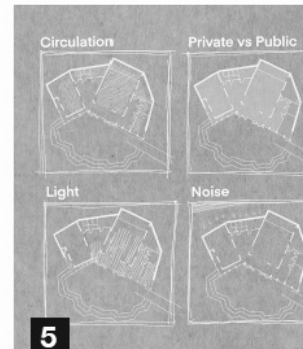

There is also a *list of requirements* we had to stick to, such as maximum area and spacial requirements. One requirement was that the terrace and the meeting room should be connected.

Poster.

For the presentations of the A-project, I made this poster. I wanted to design a poster that clearly showed the design process, while still showing an overview of the entirety of the project.

>>>U-PRO- JECT.

The goal of the U-project was to redevelop an old church in Eindhoven that was not being used to its maximum potential because of secularization.

The church that was assigned to our group was the Baptist Church at the Marconilaan. (pictured on the right). The (current) church was built in 1953 and designed by the architect H. van den Berg. By analyzing different topics and visiting the site, we designed an alternative function for the church to make the best use of the building and provide a benefit for the inhabitants of the area.

02U

Pictures.

The main assignment of this project was to write a report about all the findings that we gained during this project, and also to think of an alternative function that could be realized to make better use of the building. The first step in this project was analysis. We analysed the location, urban context, history of the building, demographic and the needs of the users.

U

u. about the church.

History.

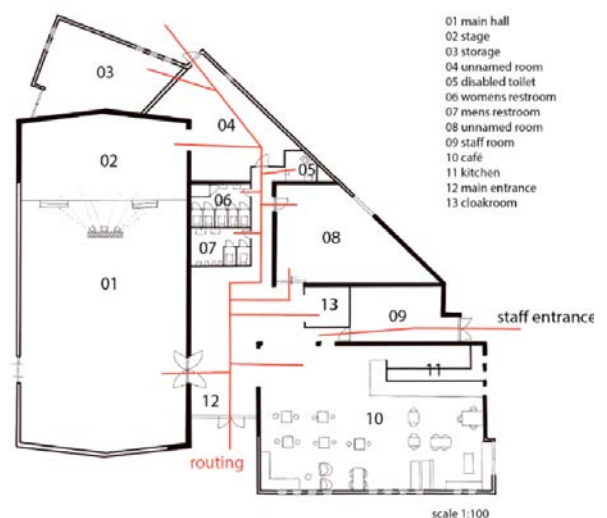

The baptist community in Eindhoven was founded on the 19th of October in 1925 by families who moved there and worked at Philips. Before the current church was built, there was a smaller, wooden baptist church. This church is pictured on the left. (fig. **5**) Later, the building was moved from the Zwaanstraat to the Wattstraat.

Surroundings.

After our analyses, we visited the site to get a better insight of the environment and to gain understanding of the area. The church is located next to the main road, as you can see in fig. **2** There is a district which is still under construction which is called Strijp-S. It is a very new and very lively part of the city, with a lot of shops, and attracts a lot of young people. There is also a park in the vicinity. This park is a really beautiful strip of green in contrast to the densely built semi-detached houses of the neighborhood.

New function.

The idea I chose for the transformation (using a multi-criteria analysis) was a community centre. It would house local theatre plays, live music, exhibitions and also has a café function. This would be the best function since it was suitable for all age groups, it stimulates the cultural development of the people living in that neighborhood and also boosts the social coherence of the residents of the neighborhoods. On the right, the floorplan I designed for the new function can be seen. (fig 6.)

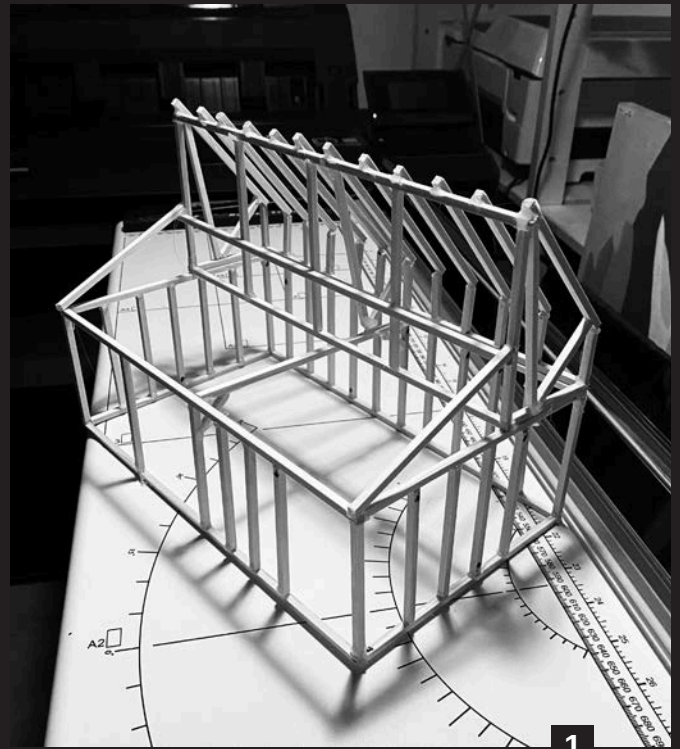

6

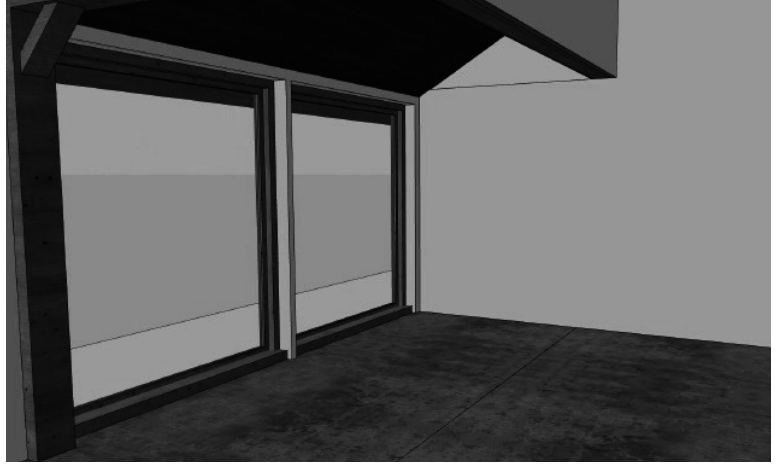

>>>B-PRO- JECT.

The goal of the B-project was to design a tiny house. We had to design this in groups of three. This tiny house was designed after we had studied the different themes of SED and BPS, which include topics like physics, health, energy, strength, material choice, sustainability and much more. We also needed to make a small model which displayed the structure of the house. I also supported our design by making a 3D model in ArchiCAD. This project taught me which things you have to think about when designing a sustainable, tiny house to ensure a low-energy house while still offering comfort. On the right, our construction model is displayed. **1**

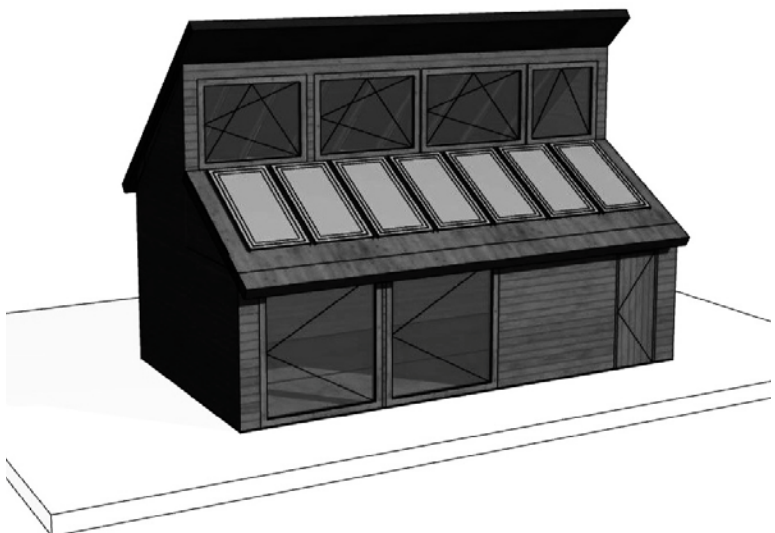

03B.

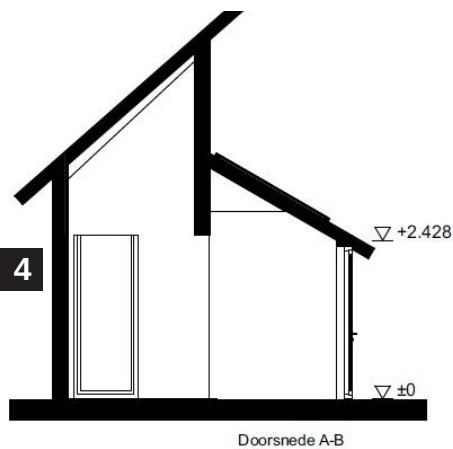

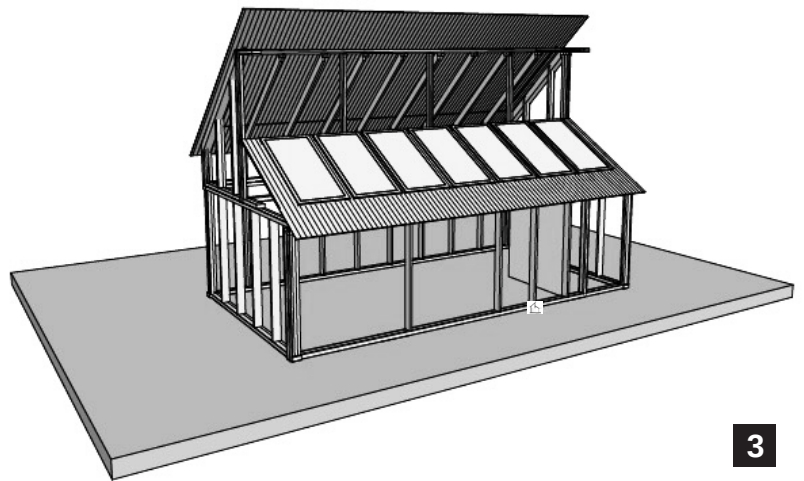

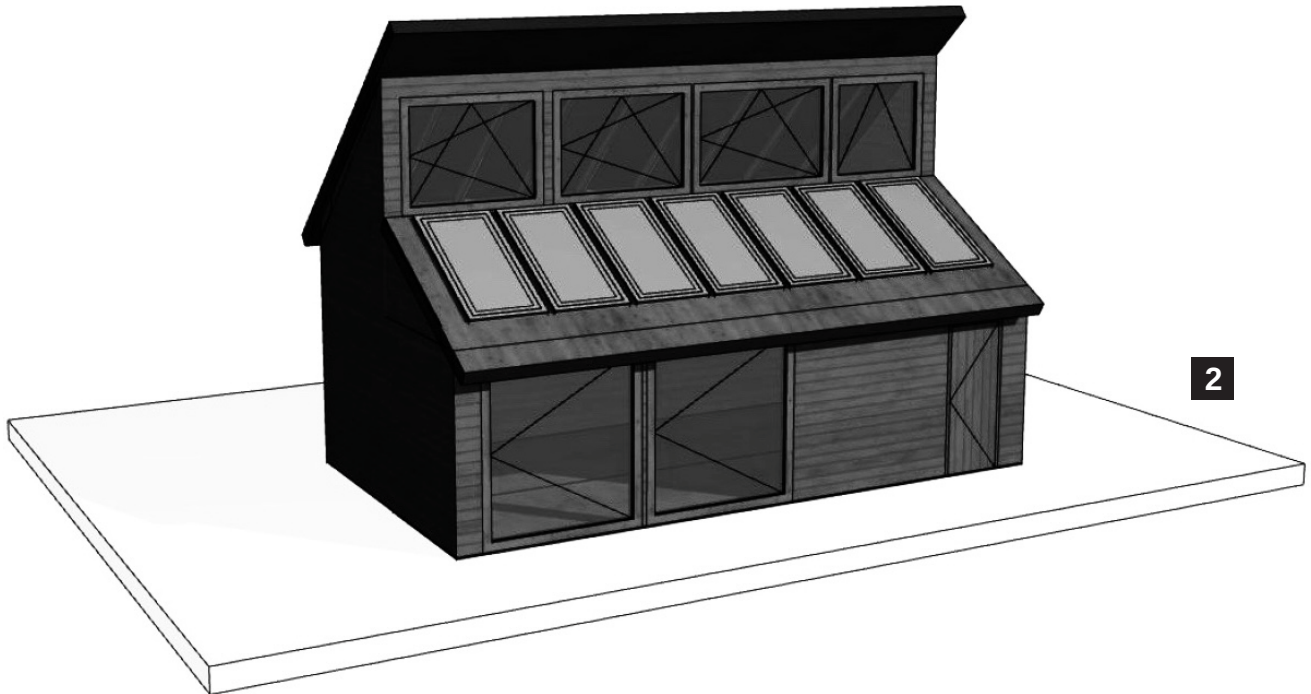

The project.

The biggest part of the B-project was to write a report supporting your design, including an analysis of the different themes of SED and BPS. We had to think about which materials we were going to use, how we were going to use the sunlight to our benefit and how well our house should be insulated, which method were going to use.

For our house, we chose timber as our main material, because of its benefits. Our construction method was a timber frame structure. We also put solar panels on top to make sure the house is a zero-energy building. The floor is made of concrete so the sunlight can warm up the concrete.

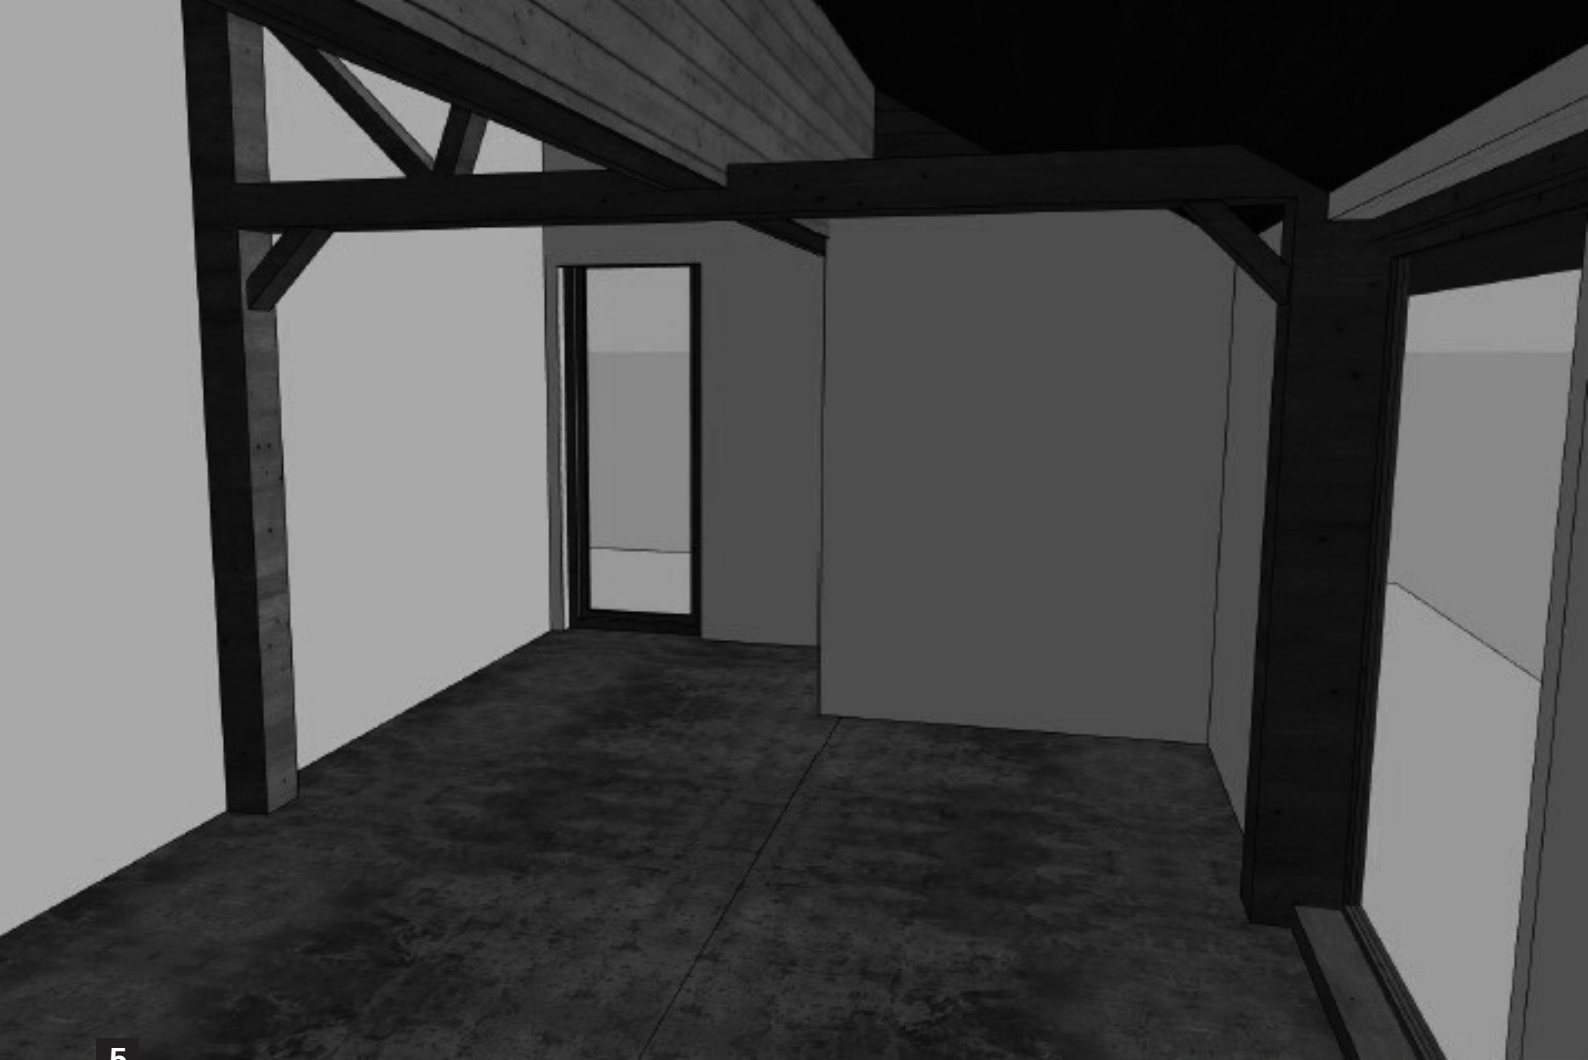

b. final result.

Models and sections.

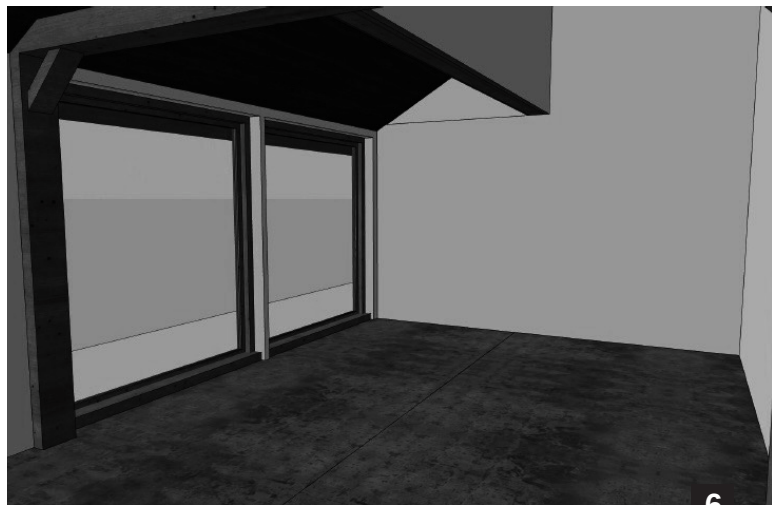

The final result is pictured above. It features an angled roof for optimal sunlight depending on the season. I also included a section i made and also our digital construction model. It displays how our timber frame structure would look like.

5

Pictures.

Fig.5 and fig. 6 show interior perspectives of our tiny house. I made these interior perspectives using ArchiCAD. They show clearly how the house would look like from the inside. As you can see, the beams are also still visible on the inside.

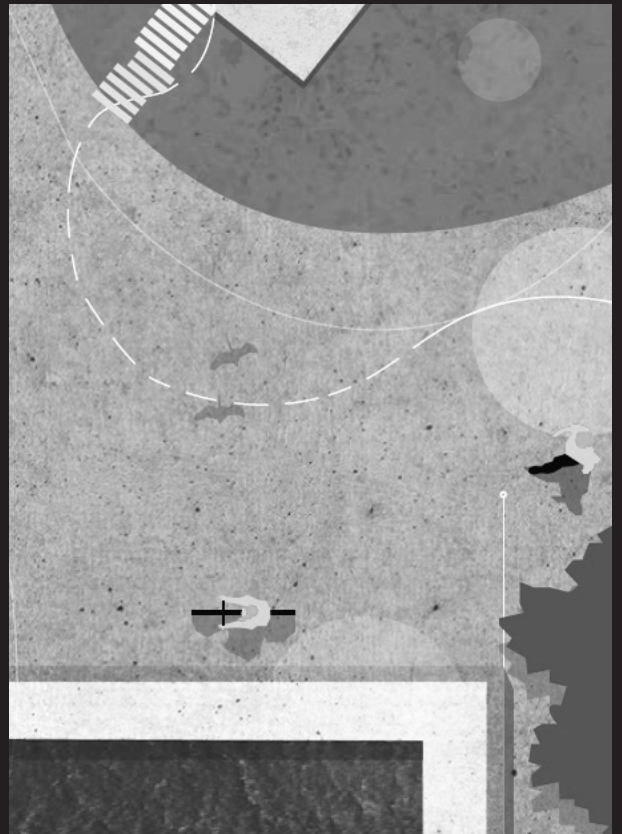

6

All in all, I really enjoyed this project. I liked that we first had to analyse the different themes and use that knowledge to design a house. What I also really enjoyed is working with archiCAD. It is really useful to have your drawings displayed in 3D. These images give a very good insight into what it would look like in real life.

>>> MEDIA & SKILLS.

Media&skills was also set of exercises that I very much enjoyed. I already knew a lot about the adobe software, so for me it was very easy and a lot of fun to work with them.

Handdrawing has also been very fun and helpful. I feel like because of these classes I really developed my own style and I learnt a lot about perspective. On the next page, I will showcase some of the drawings i had to make for the handdrawing class.

4x4 Student house Map 6

For the illustrator assignment, we had to do two assignments. We first had to make a map of the location of our tiny house that we designed. The location I chose was on the KOE-veld on our campus.

The next illustrator assignment is visible on the next page (fig 7.) The assignment was to design a infographic about the use of the tiny house during three weekdays.

4x4 Student house

Infographic 7

Iris Schoutsen

The use of a 4x4 Student House

This infographic has the intent of showing the use of a 4x4 student house during two full days of the week; this infographic will cover the week from Wednesday 15:00 until Friday 15:00. Graphic #1 shows the floor plan and the usage of the different areas. Graphic #2 shows the division of time between the different activities, and graphic #3 is a timeline showing the chronological order of the activities.

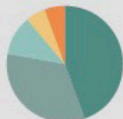

Daily planning and pie charts

The pie charts show the division of time between the activities each day. Next to that is a description of the activities per day. On the right, the legend is displayed.

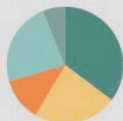

Wednesday

The Wednesday afternoon is mainly used for studying. After that, dinner is bought at the store. In the evening, a friend comes over to chat and study together. The rest of the evening is spent playing the guitar. After that, the student goes to sleep.

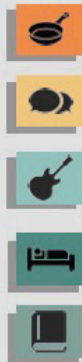

Thursday

On Thursday the majority of time is spent in bed. It is a day for sleeping in. After waking up, it is time for breakfast. The small table can be unfolded and is a place to eat. After enjoying the first meal of the day, it is time to study. The unfolded table now functions as a desk. After studying hard for several hours, it is time to relax by playing guitar on the couch. At the end of the day, a friend comes over to cook dinner together. After that, the student goes to sleep.

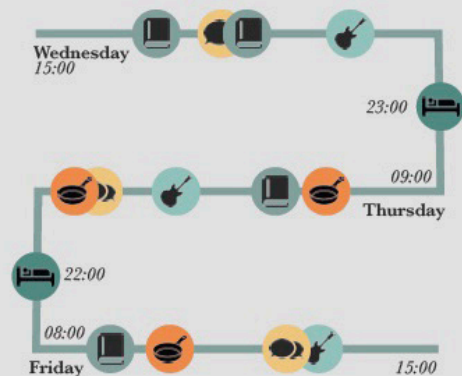

Friday

Friday means weekend. When the student has awoken from their sleep, they firstly do their assignments for the day. Next, they cook a special lunch to celebrate the weekend. After that, a friend comes over to make music together and chat.

Timeline

Displayed below is the usage of the house from Wednesday until Friday in a simple timeline.
